

Thermal bridges are the CURSE of concrete framing

- Details MUST be developed to insert a thermal (insulation) break between the exterior and the interior

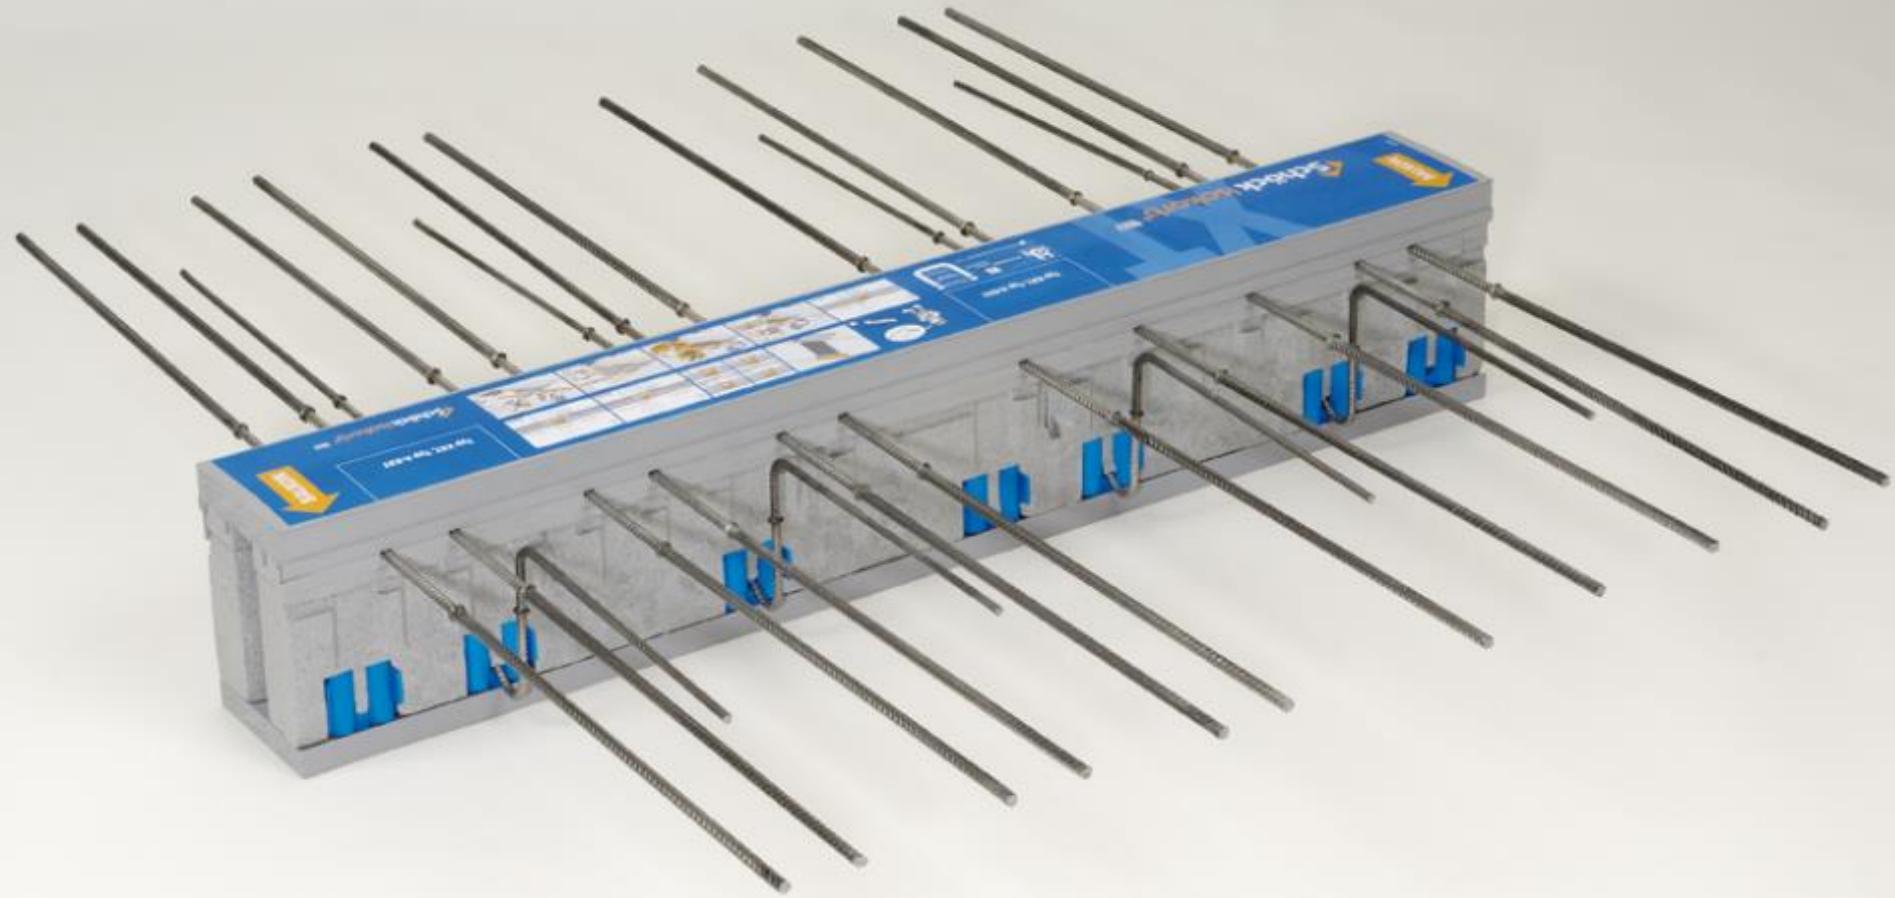

Putting insulation
between layers of cast
in place concrete for
that "all concrete" look

This method is **VERY** uncommon
as it costs a lot extra.

Precast and Prestressed Concrete

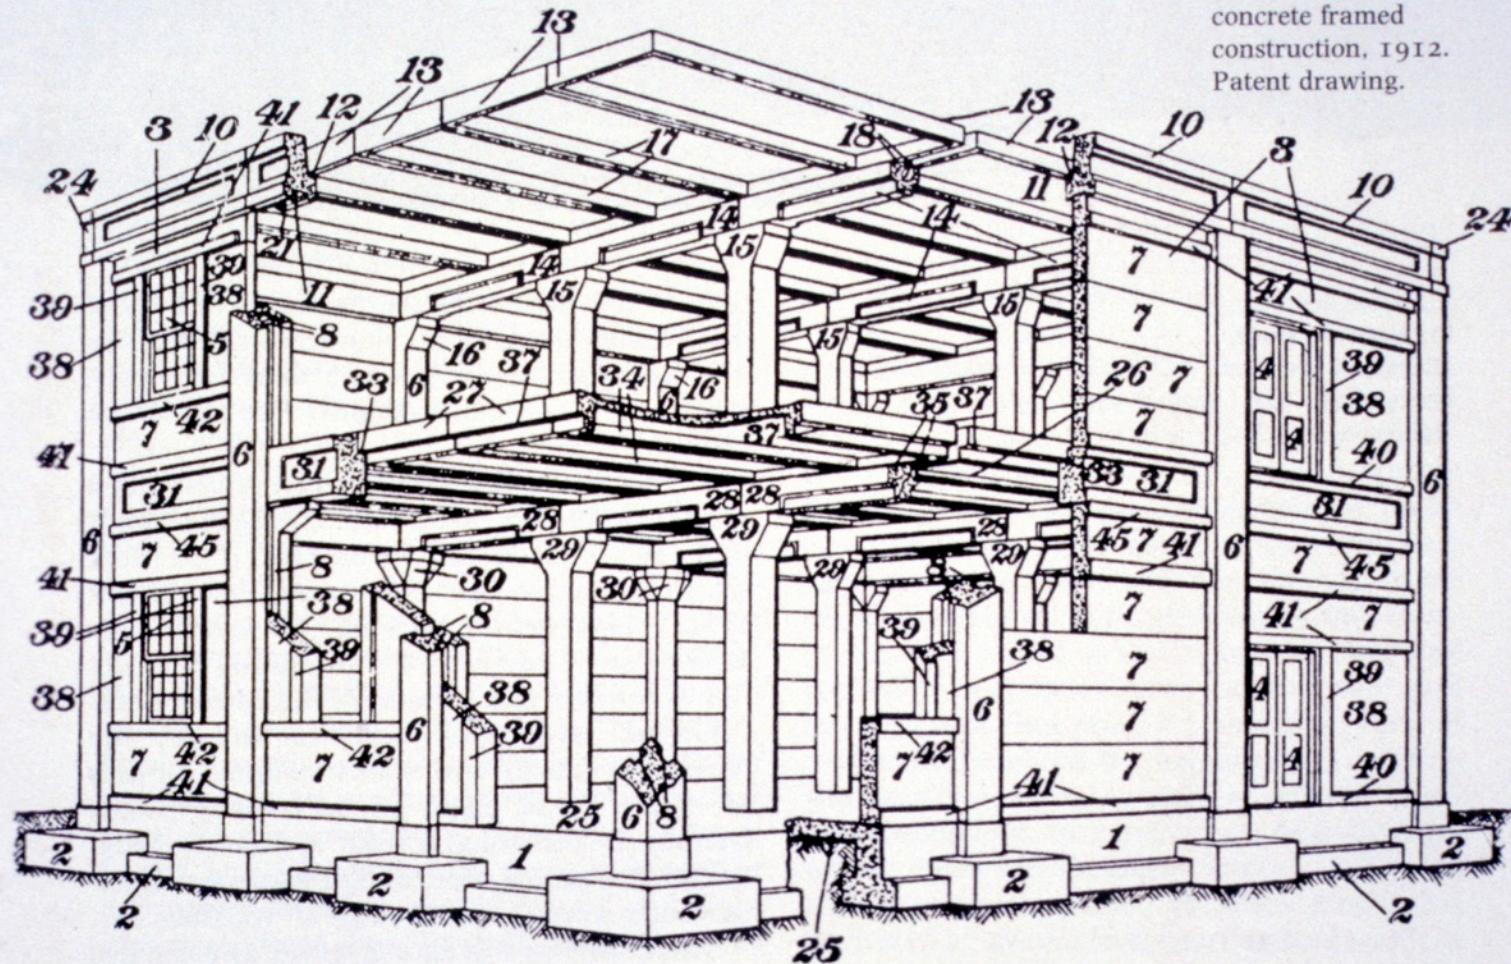

Arch 173: Building Construction 2
Winter 2024

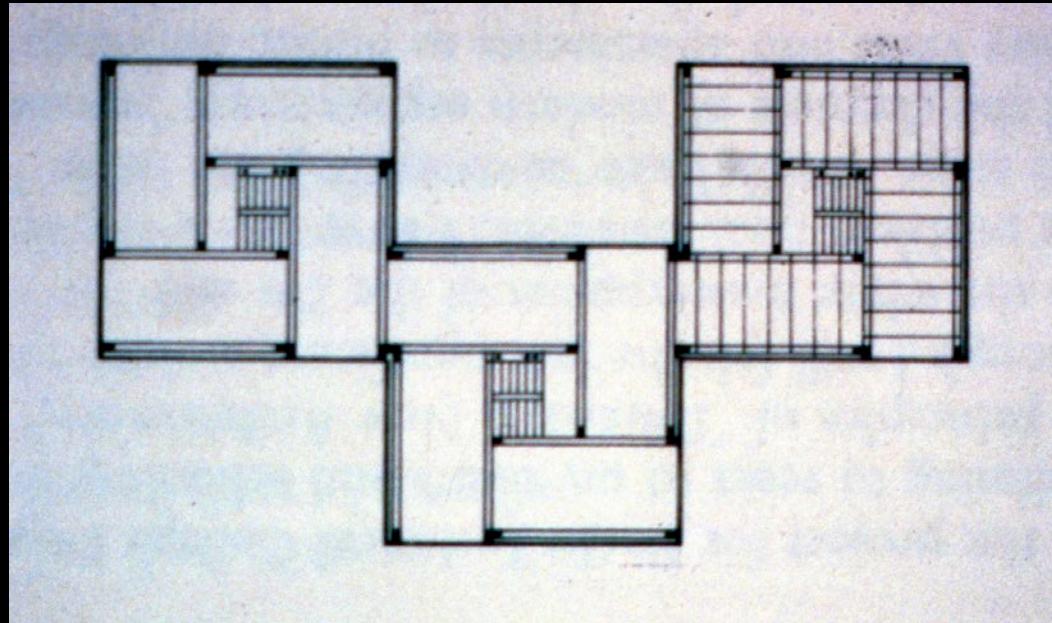

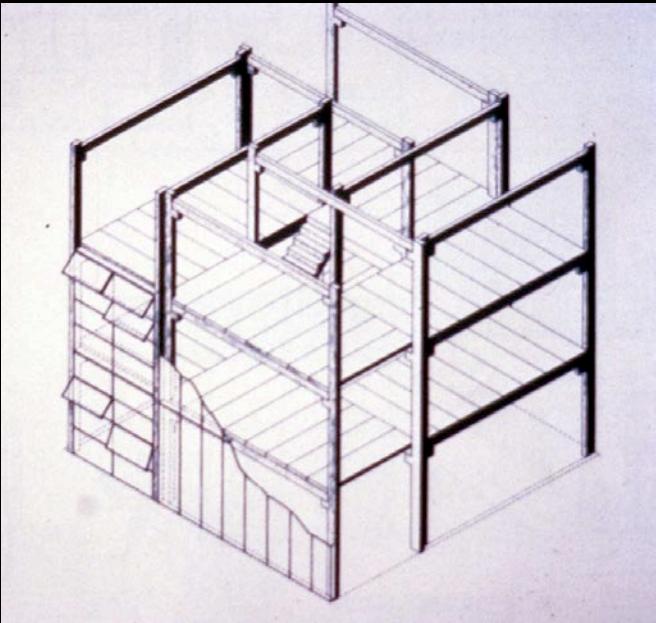

“In the next twenty years, big industry will have co-ordinated its standardized materials . . . technical achievements will have carried . . . methods of rational construction far beyond anything we are acquainted with.”
—Le Corbusier, 1914

Precast concrete came about in the early 1900s as a response to industrialization.

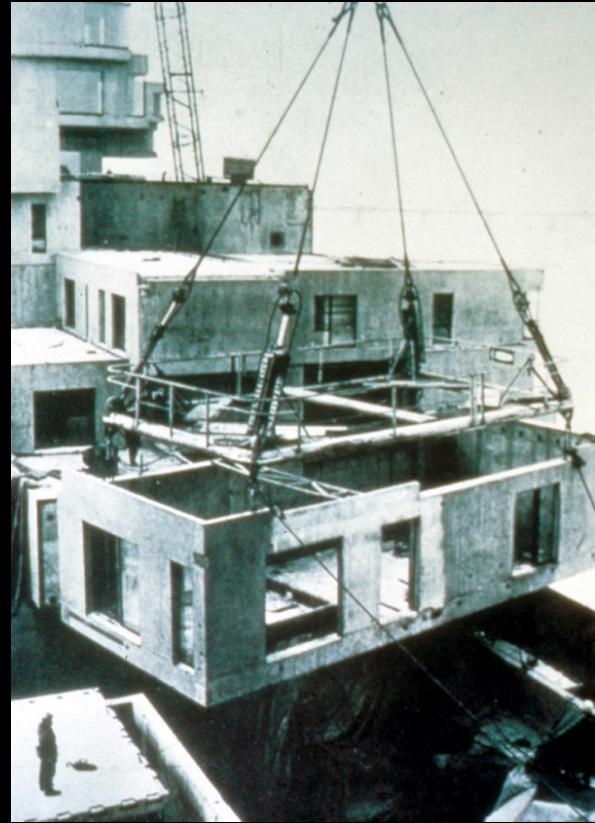

How could you use concrete but without on site wet processes?

4.10 Conzelman system of precast-concrete framed construction, 1912. Patent drawing.

Lift Slab Construction

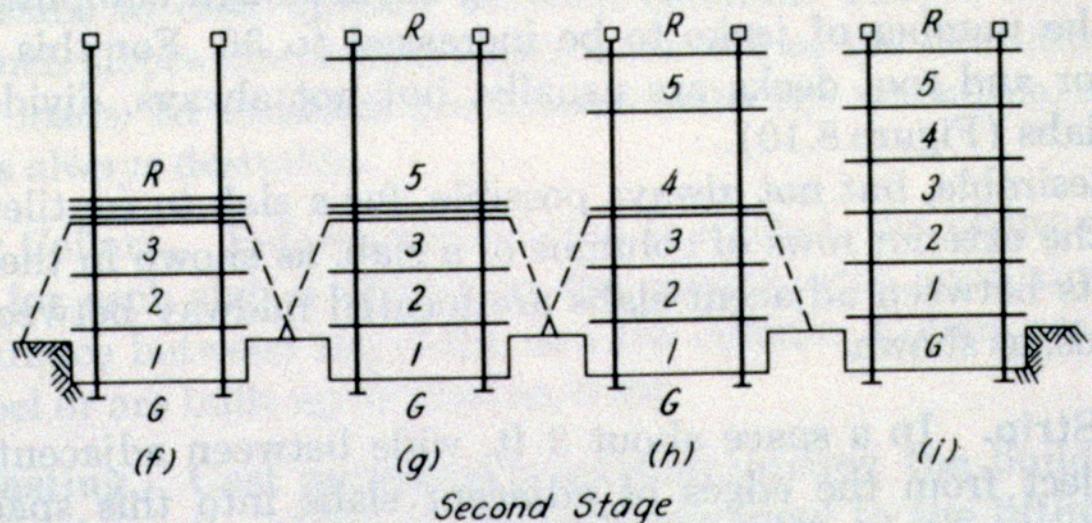

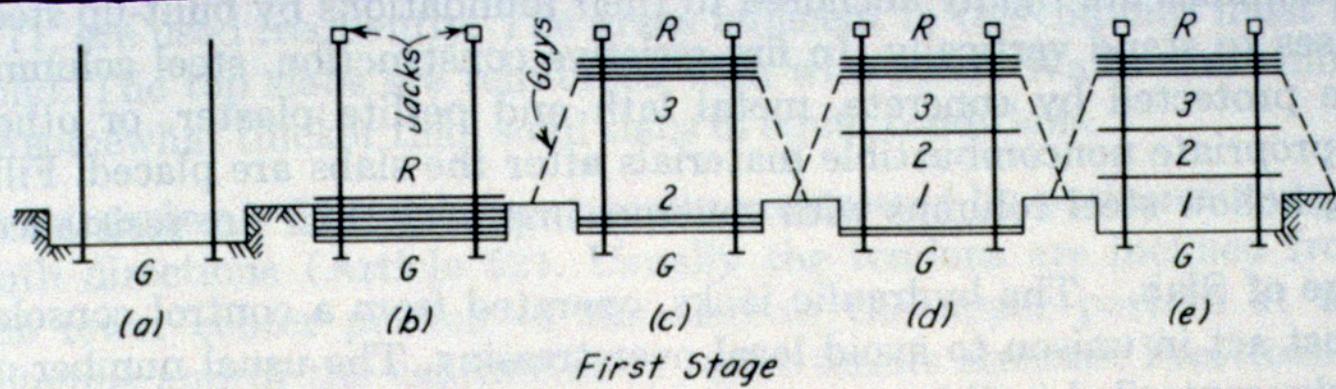

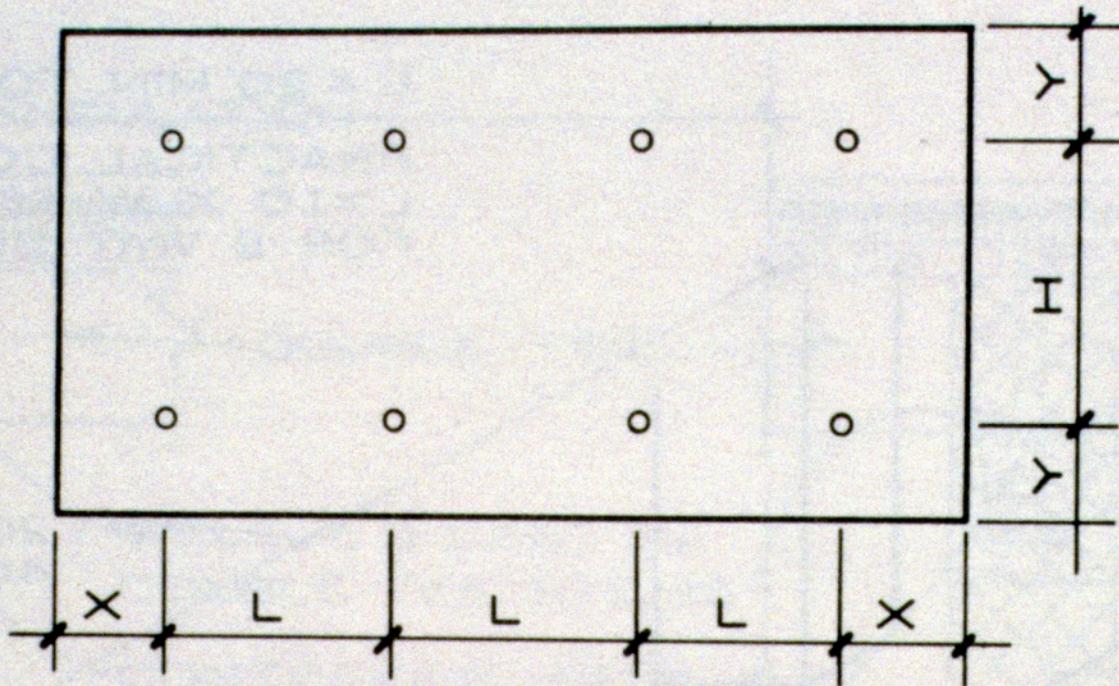

FIGURE 8.8 Sequence of lifting operations.

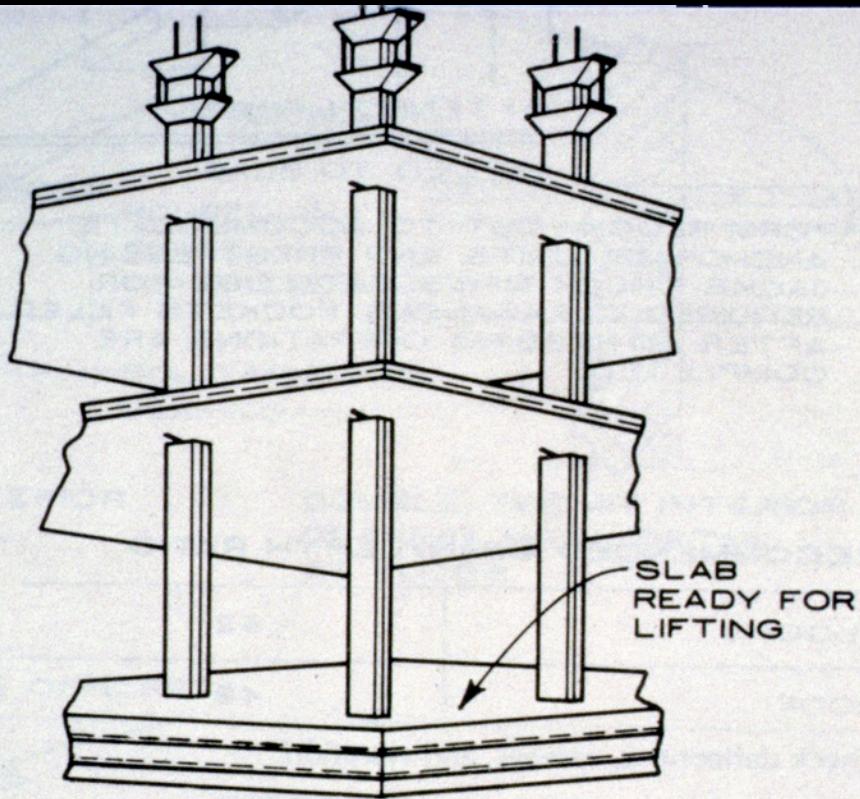

BEST RESULTS OCCUR WHEN
CANTILEVERS ARE PROPORTIONED
AS FOLLOWS:

$Y = 25\% H \text{ MIN}; 40\% H \text{ MAX.}$

$X = 25\% L \text{ MIN}; 40\% L \text{ MAX.}$

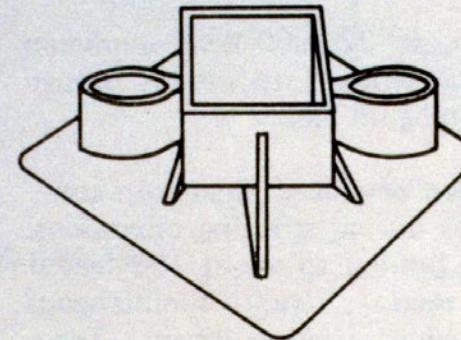

PLAN OF LIFT - SLAB

SCHEMATIC ISOMETRIC OF LIFT-SLAB METHOD

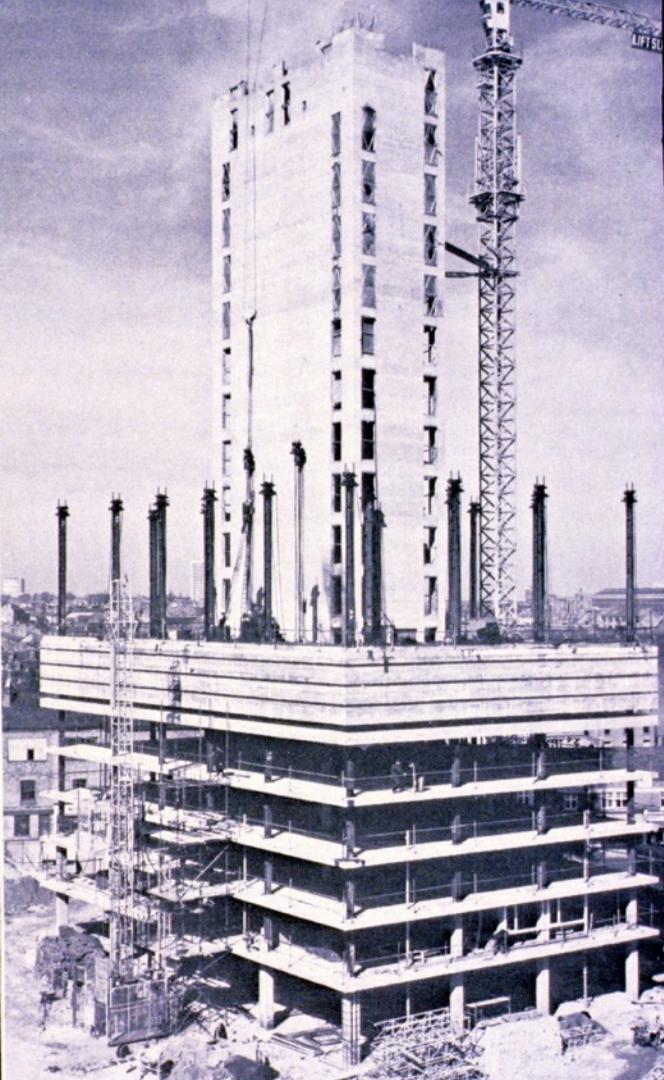

NOTE :

Schematic shows jacks at top of columns, lifting rods, shear bars under slabs. The slabs can be pre-stressed, post-tensioned, or reinforced concrete.

TYPICAL COLLAR USED IN LIFT-SLAB CONSTRUCTION

LIFT-SLAB CONSTRUCTION

<https://www.presconinc.com/prescon-technology/lift-slab/>

The lift slab method was fatefully implemented in the L'Ambiance Plaza development in Bridgeport, Connecticut. What was set to be a 16-storey residential project suddenly collapsed on April 23, 1987, killing 28 construction workers.

Precast Concrete Cladding Types:

1. Old style uninsulated panel hung from the floor slabs
 - with steel stud back up and batt insulation (bad)
 - with steel stud back up and impermeable spray foam insulation (better)
 - better if also installed as a rain screen
2. Sandwich panel with impermeable insulation between
 - Best if accompanied by a rain screen drainage behind

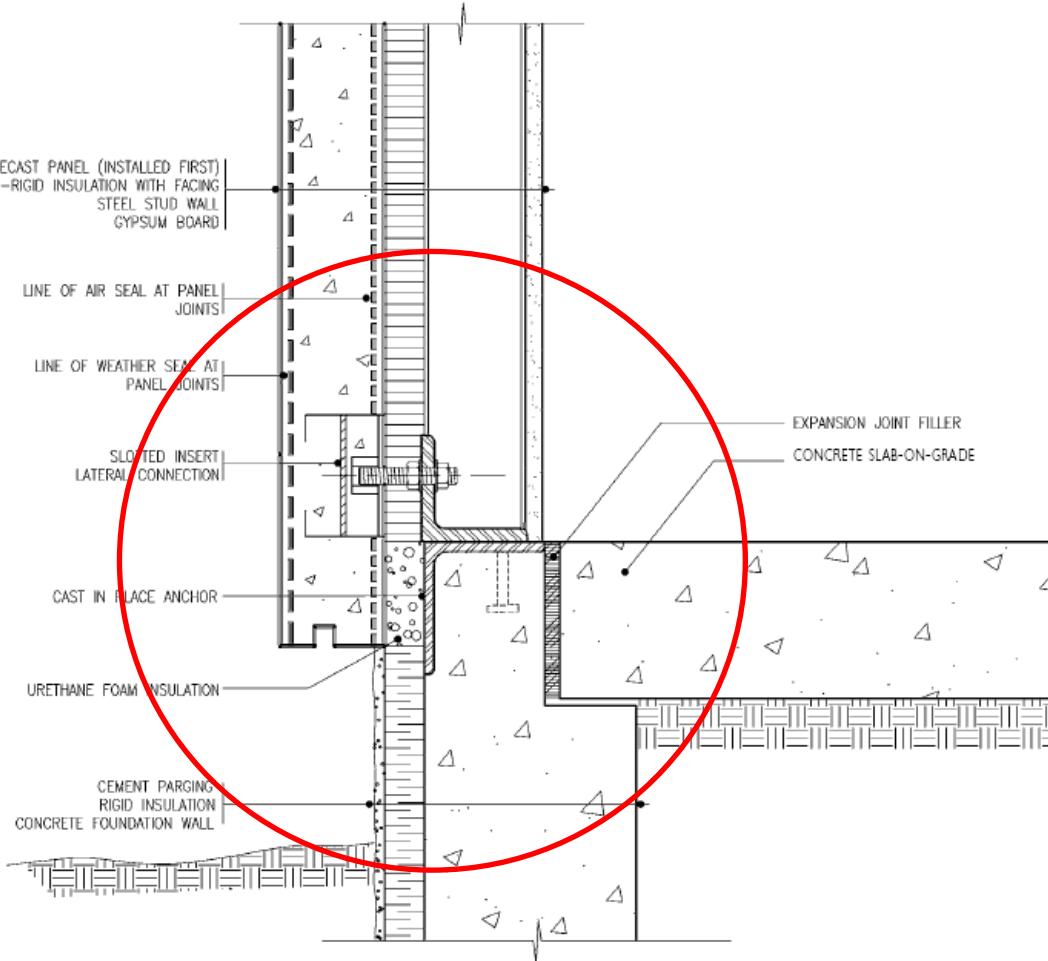

Two-Stage Joint—An inner and outer seal provide drainage at joints. The outer seal is exposed to the elements and gets trashed by the UV and heat and water but the assembly still works because of the interior protected seal. This interior seal is installed from the exterior for continuity reasons.

Figure 12. Intersection between horizontal and vertical two-stage joints in an external wall

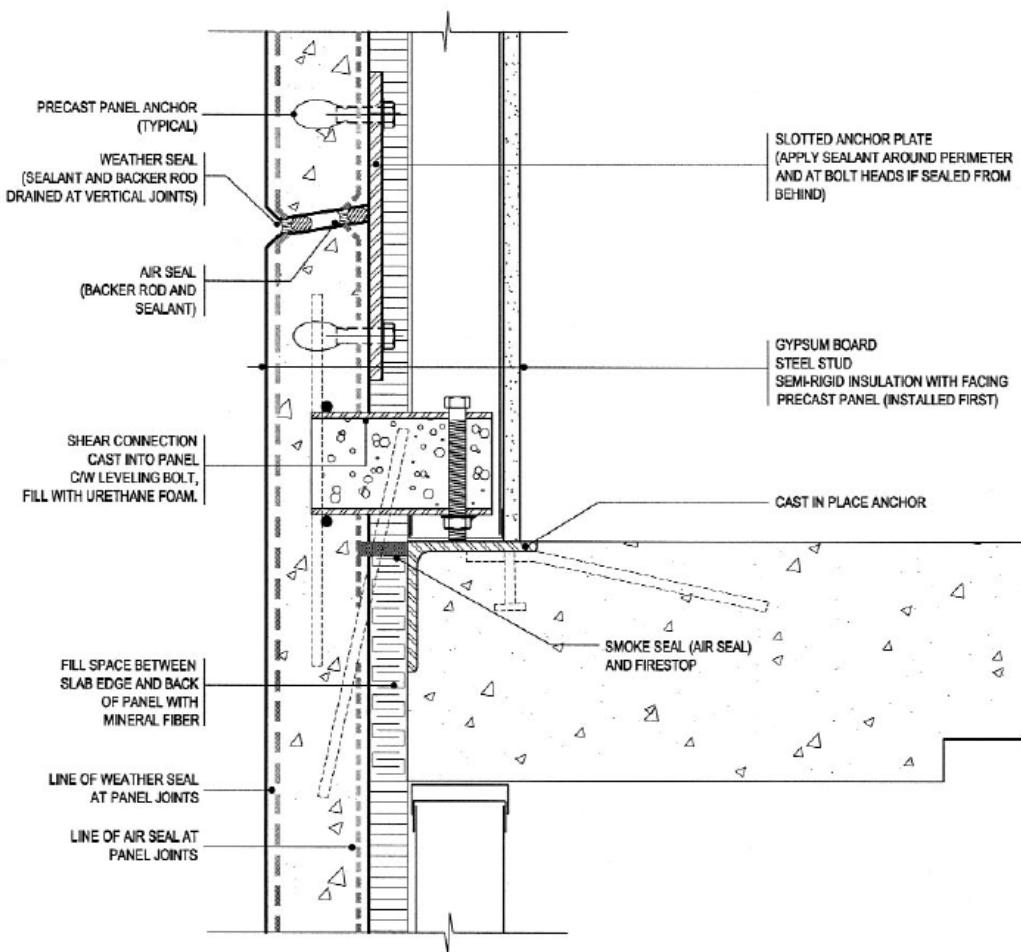

Face-sealed cladding (“perfect barrier”) that is impermeable to water vapor. It is insulated on the interior with air permeable insulation usually held in place between steel studs or impaled on pins protruding from the back of the cladding and covered by a vapor barrier.

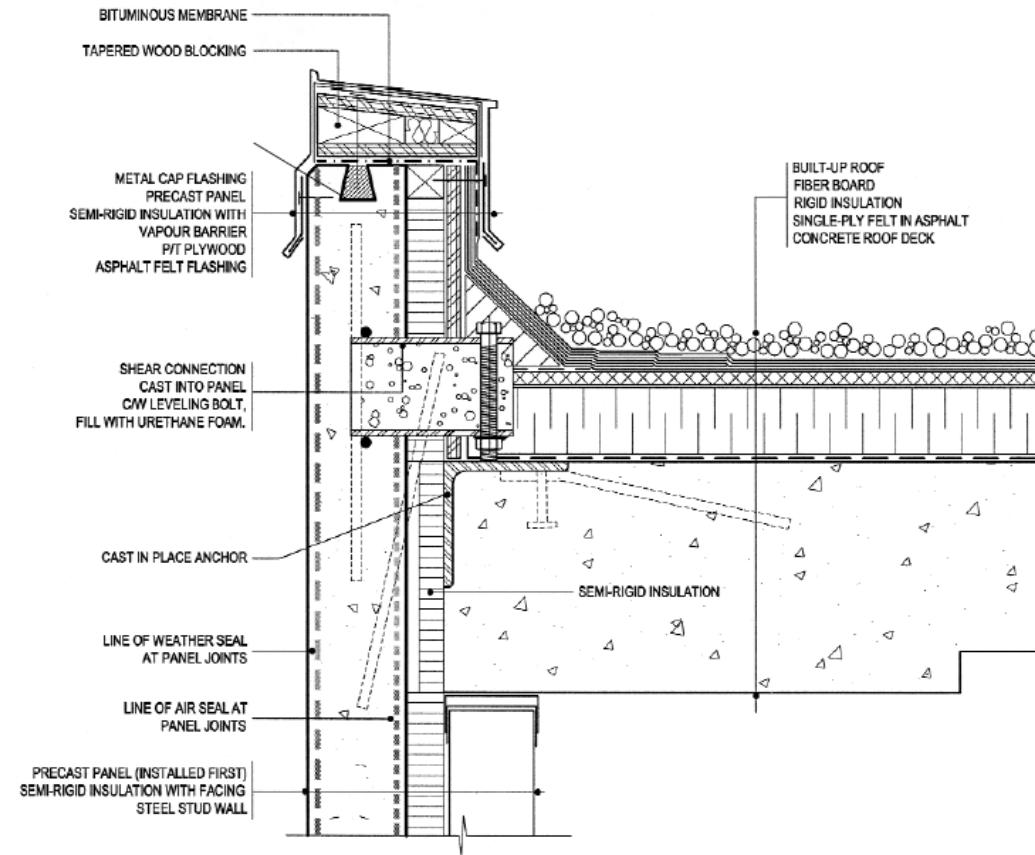

BAD DETAIL as the face seal is likely to fail and the cavity is not designed as a rain screen to drain.

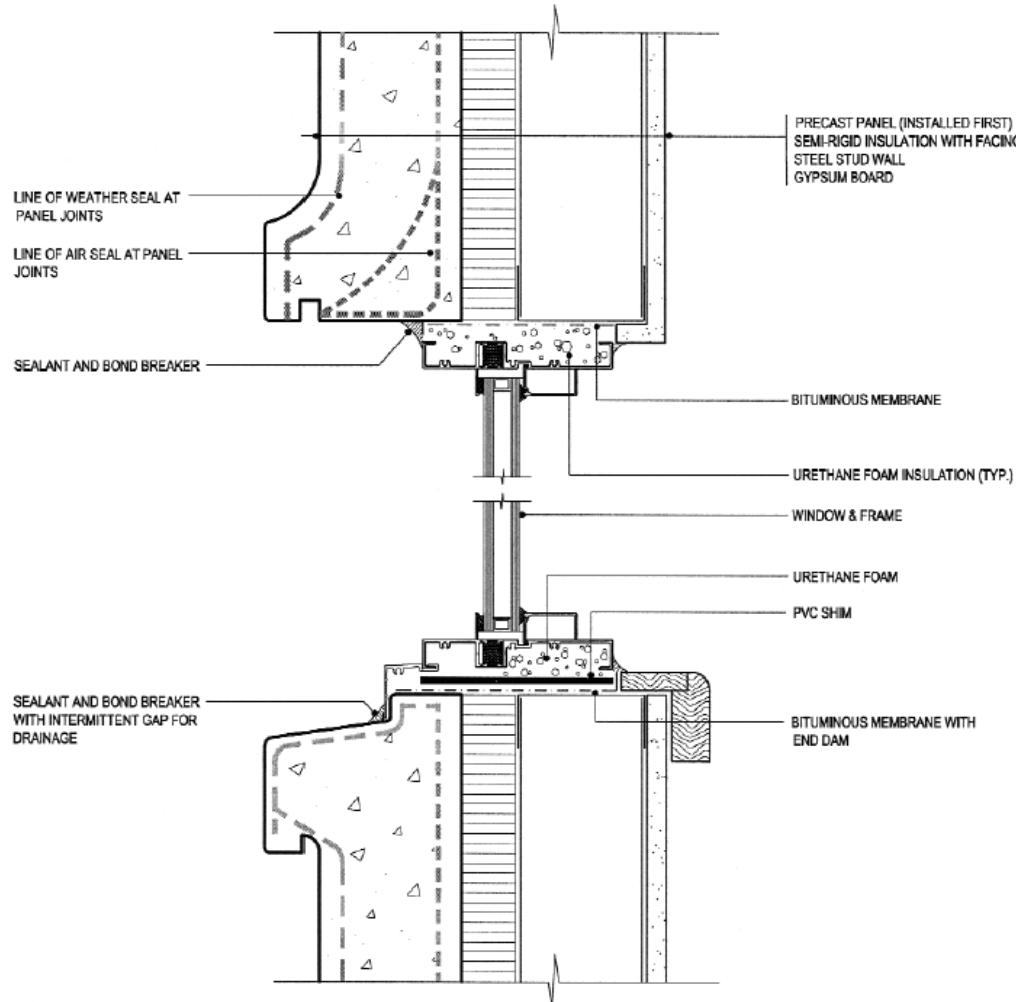

CONVENTIONAL PANEL
SLAB BEARING CONNECTION

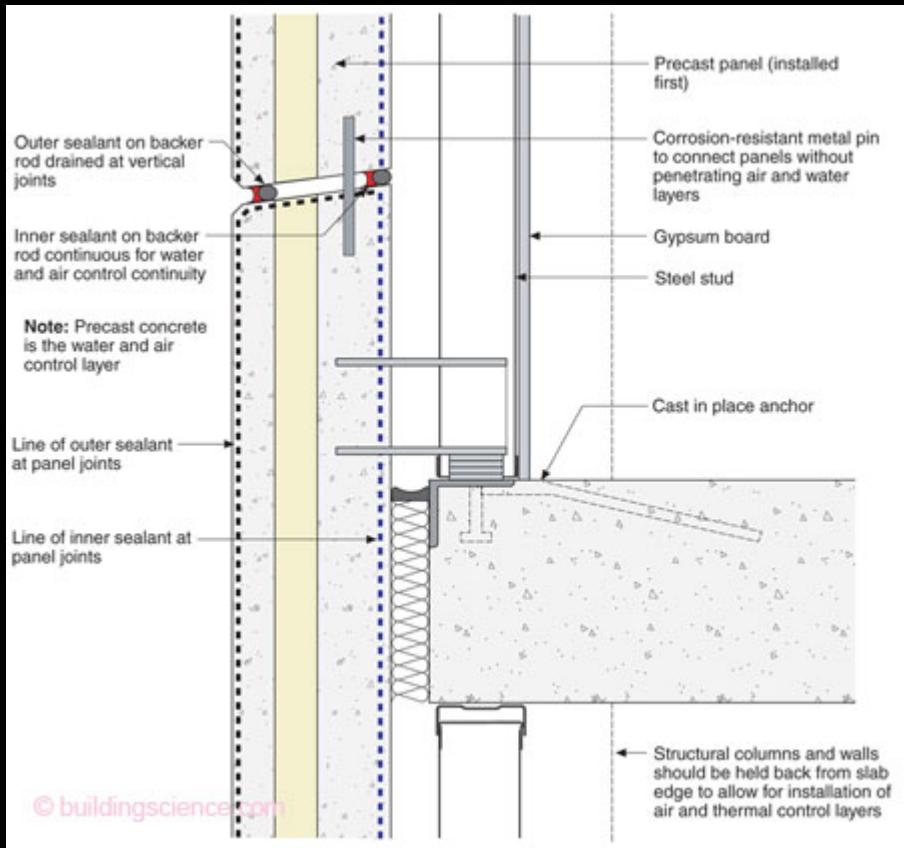

CONVENTIONAL PANEL
TOP HUNG PARAPET CONNECTION

CONVENTIONAL PANEL
WINDOW HEAD/SILL CONNECTION

SANDWICH PANEL WITH RAINSCREEN
BEARING CONNECTION TO SLAB EDGE

Sandwich Panel—Low risk preinsulated precast panel. Rigid insulation located between two layers of concrete that comprise the panel.

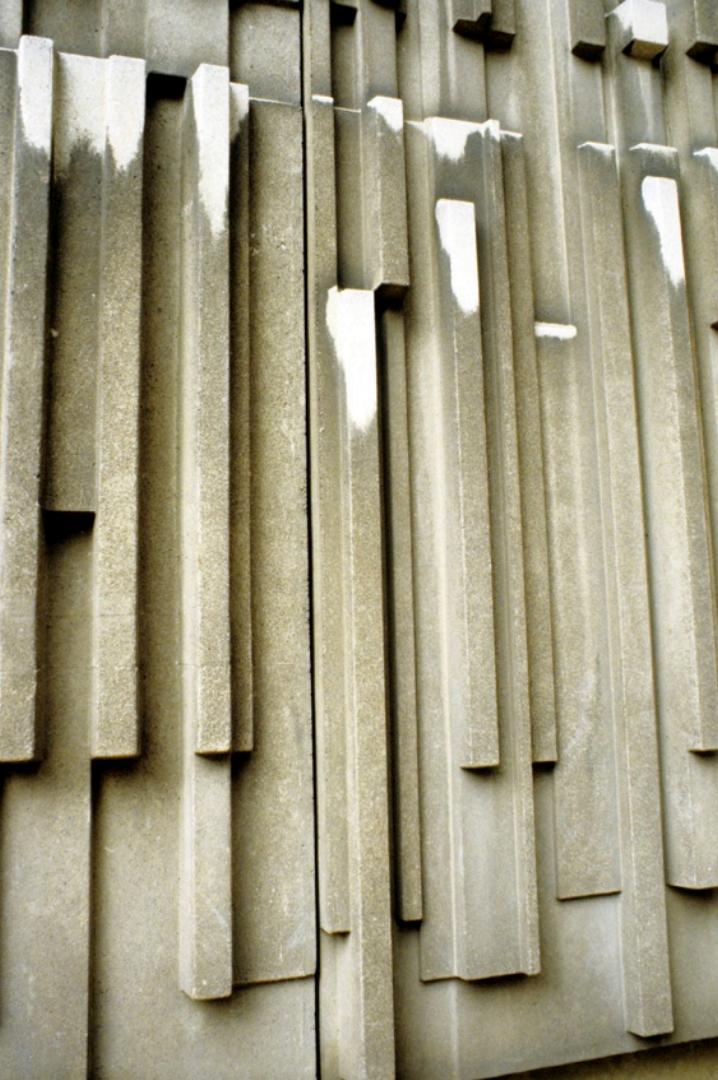

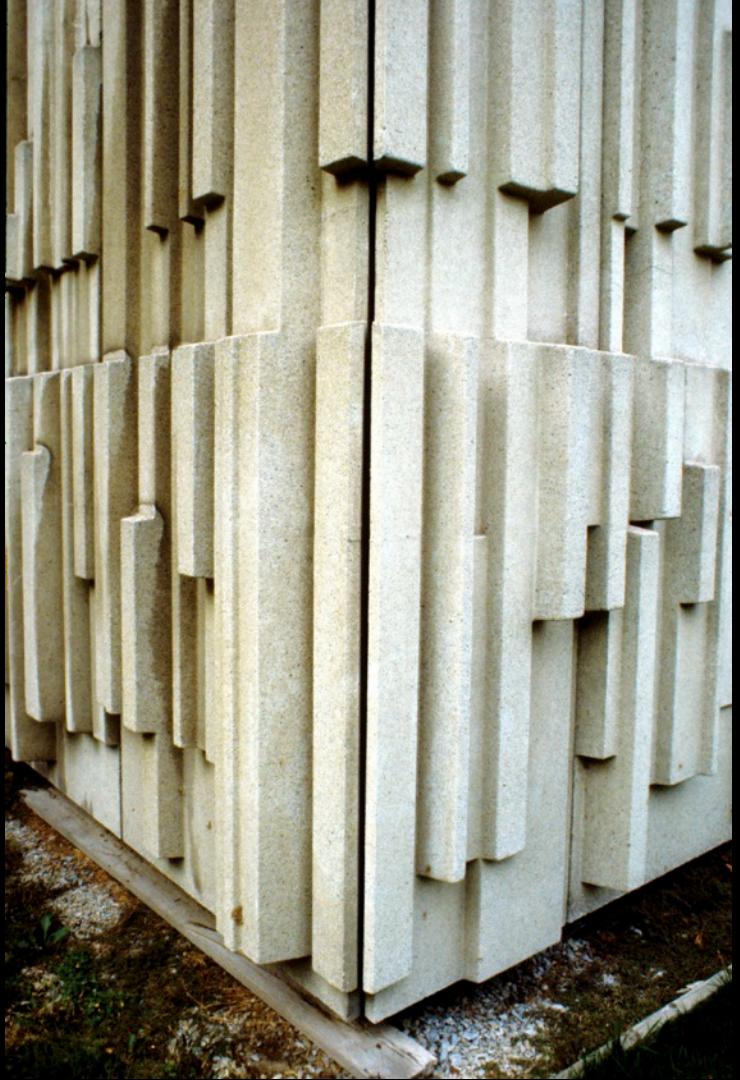

Weathering is a big issue in urban projects.

The rain washes down the building and deposits dirt as it slows down.

Worse on smooth finished precast.

Ken Wiseman, Senior Designer

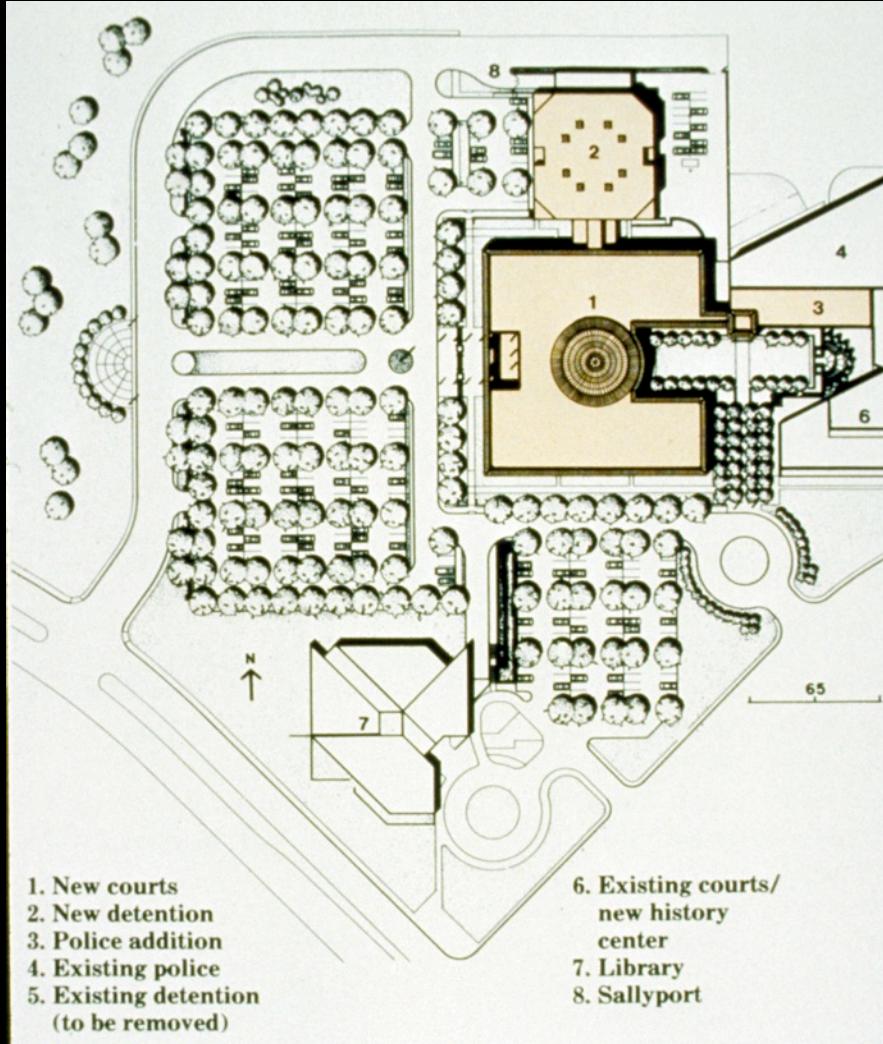

Ken Leibowitz, Structural Engineer

General Contractor: Weitz-Cohen Construction Co.

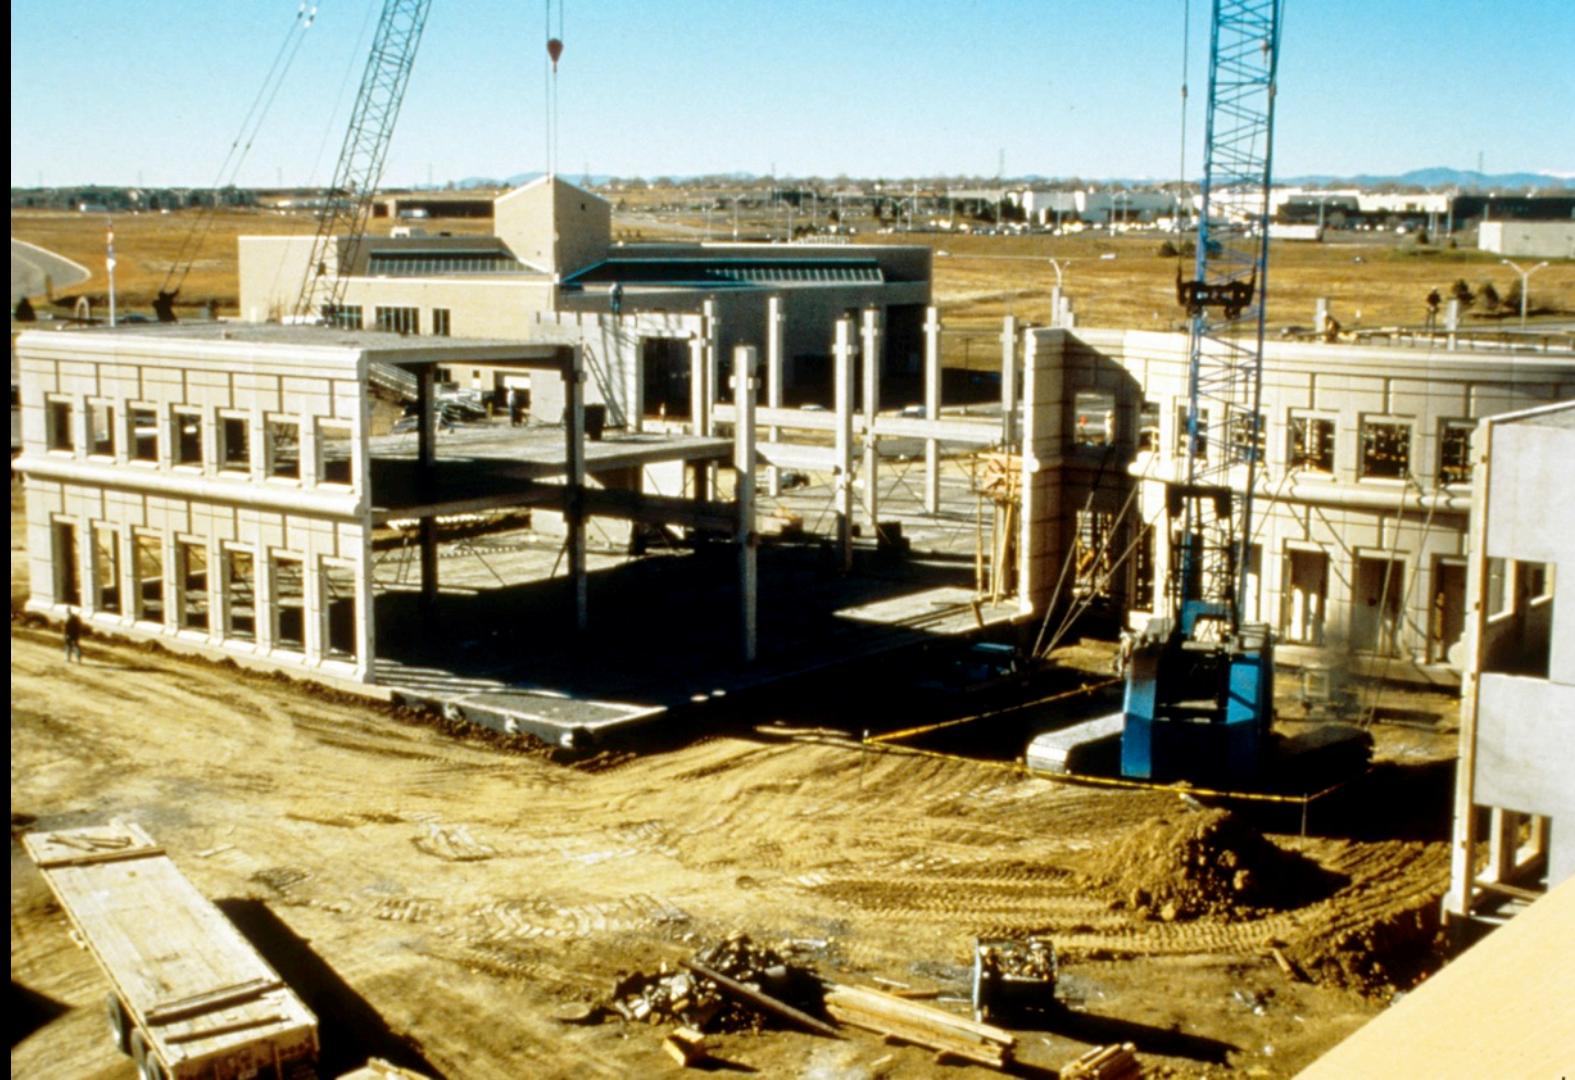

Precast / Prestressed Concrete Manufacturer:

Rocky Mountain Prestress, Inc. Denver, Colorado

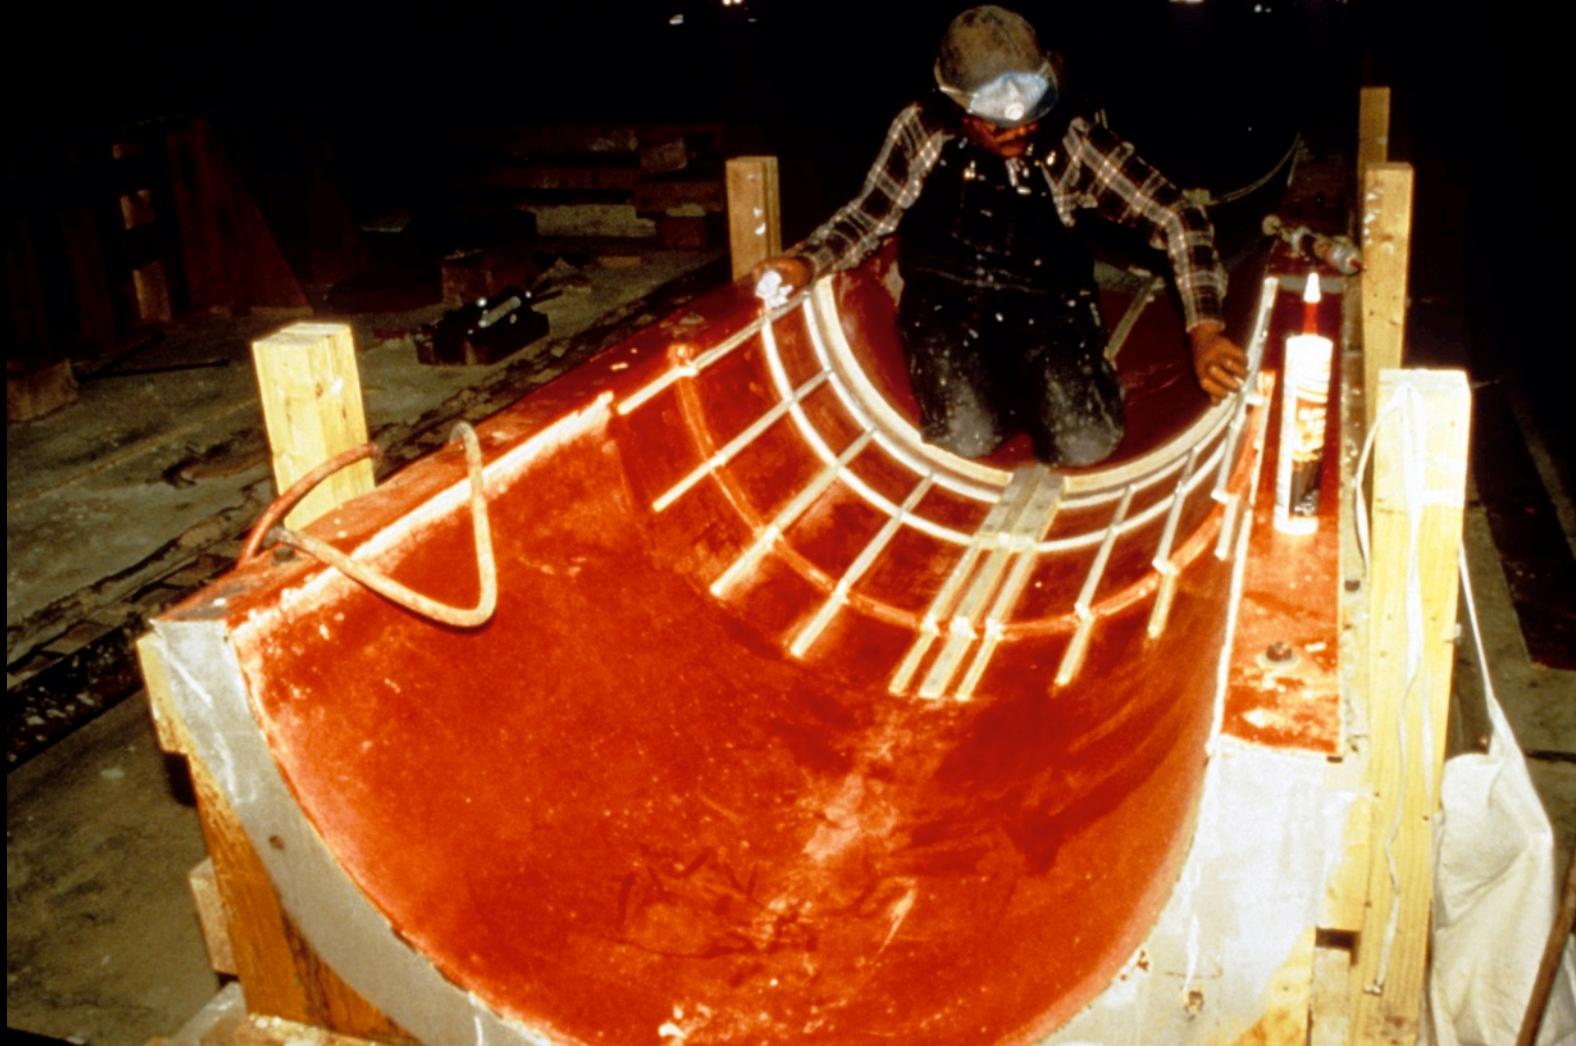

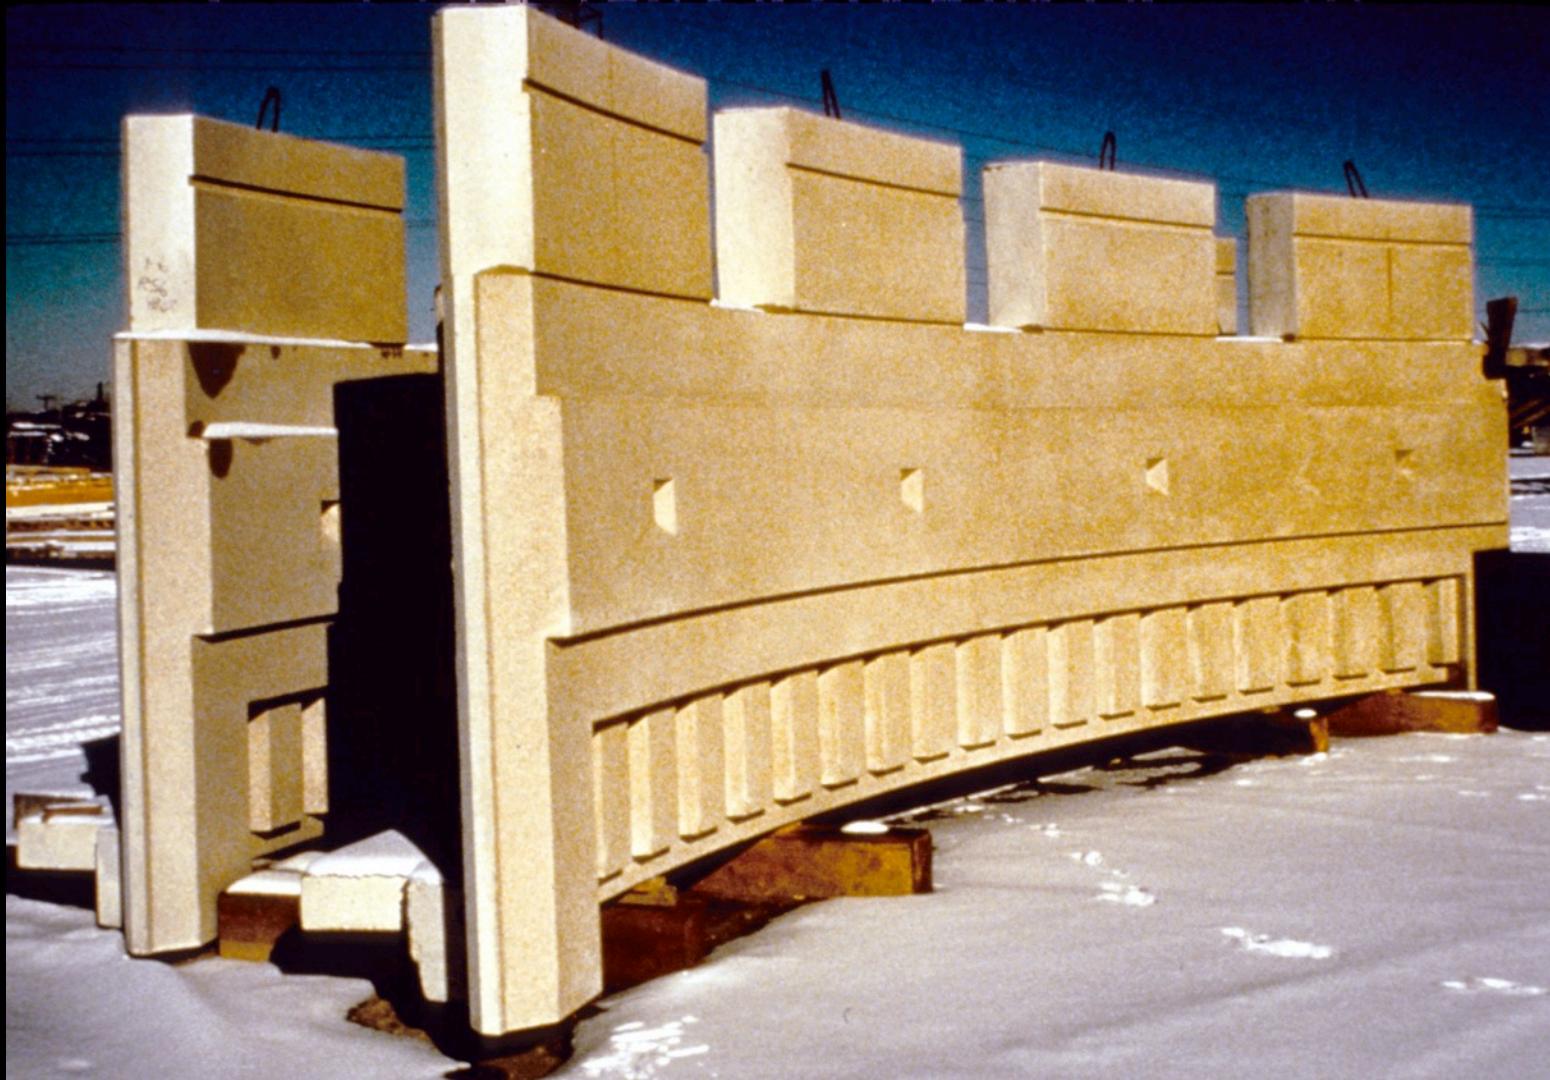

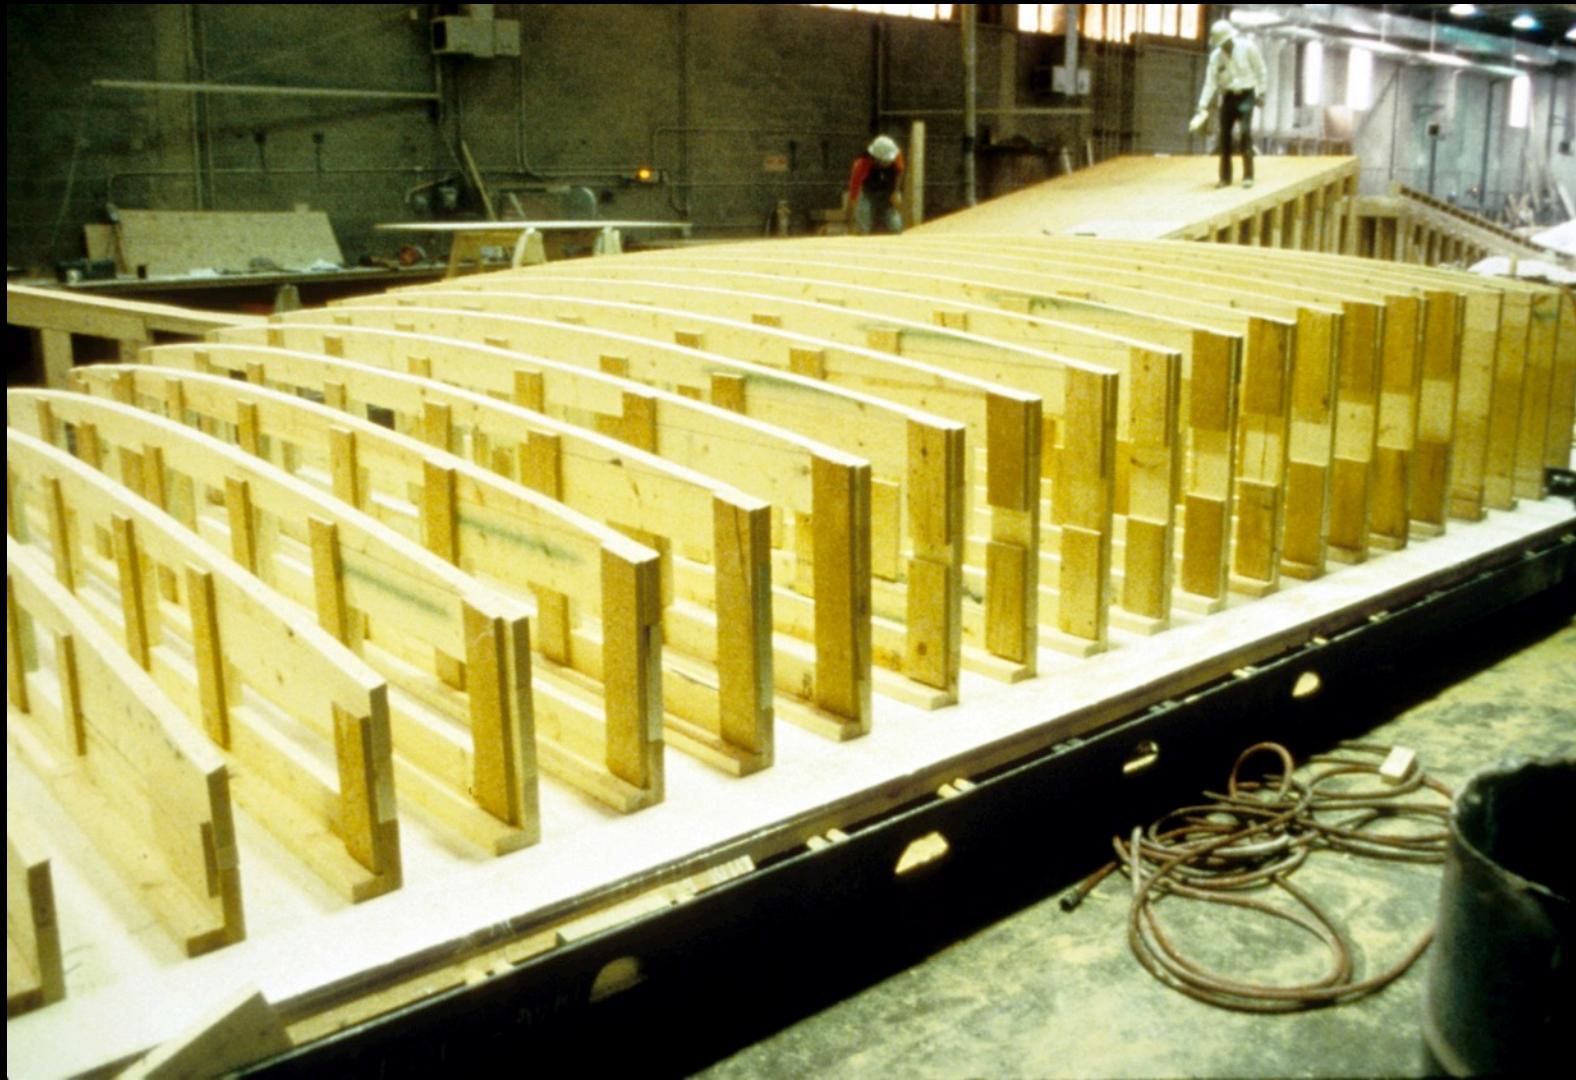

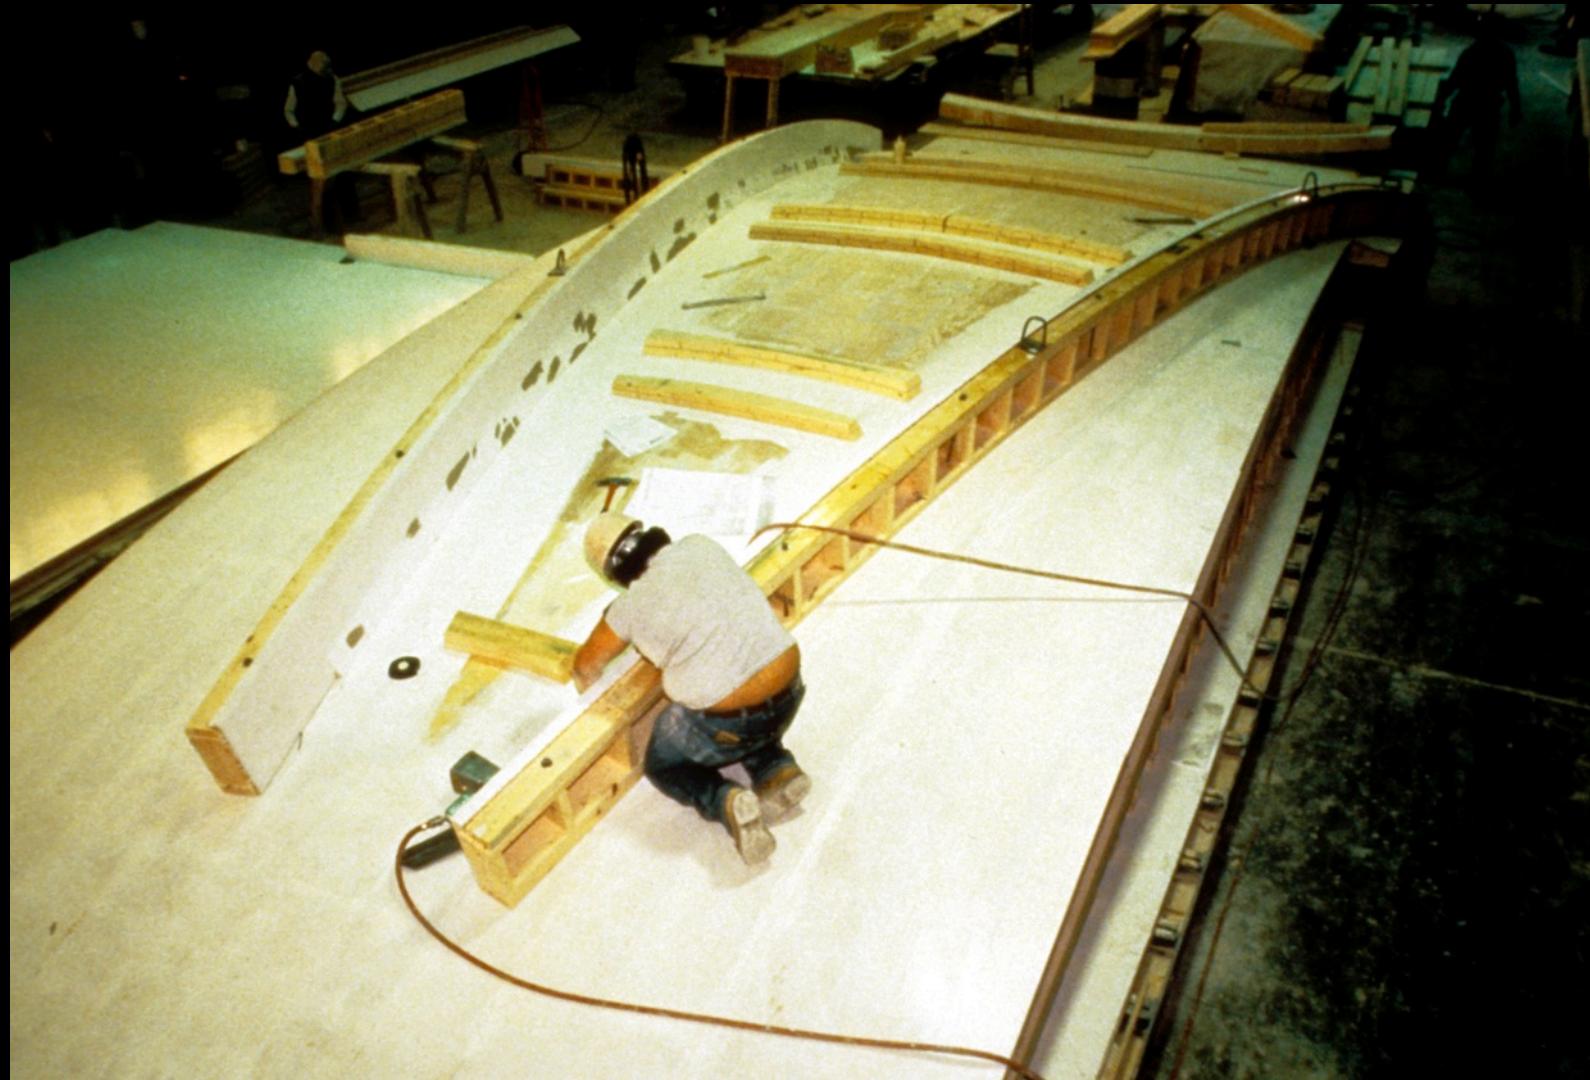

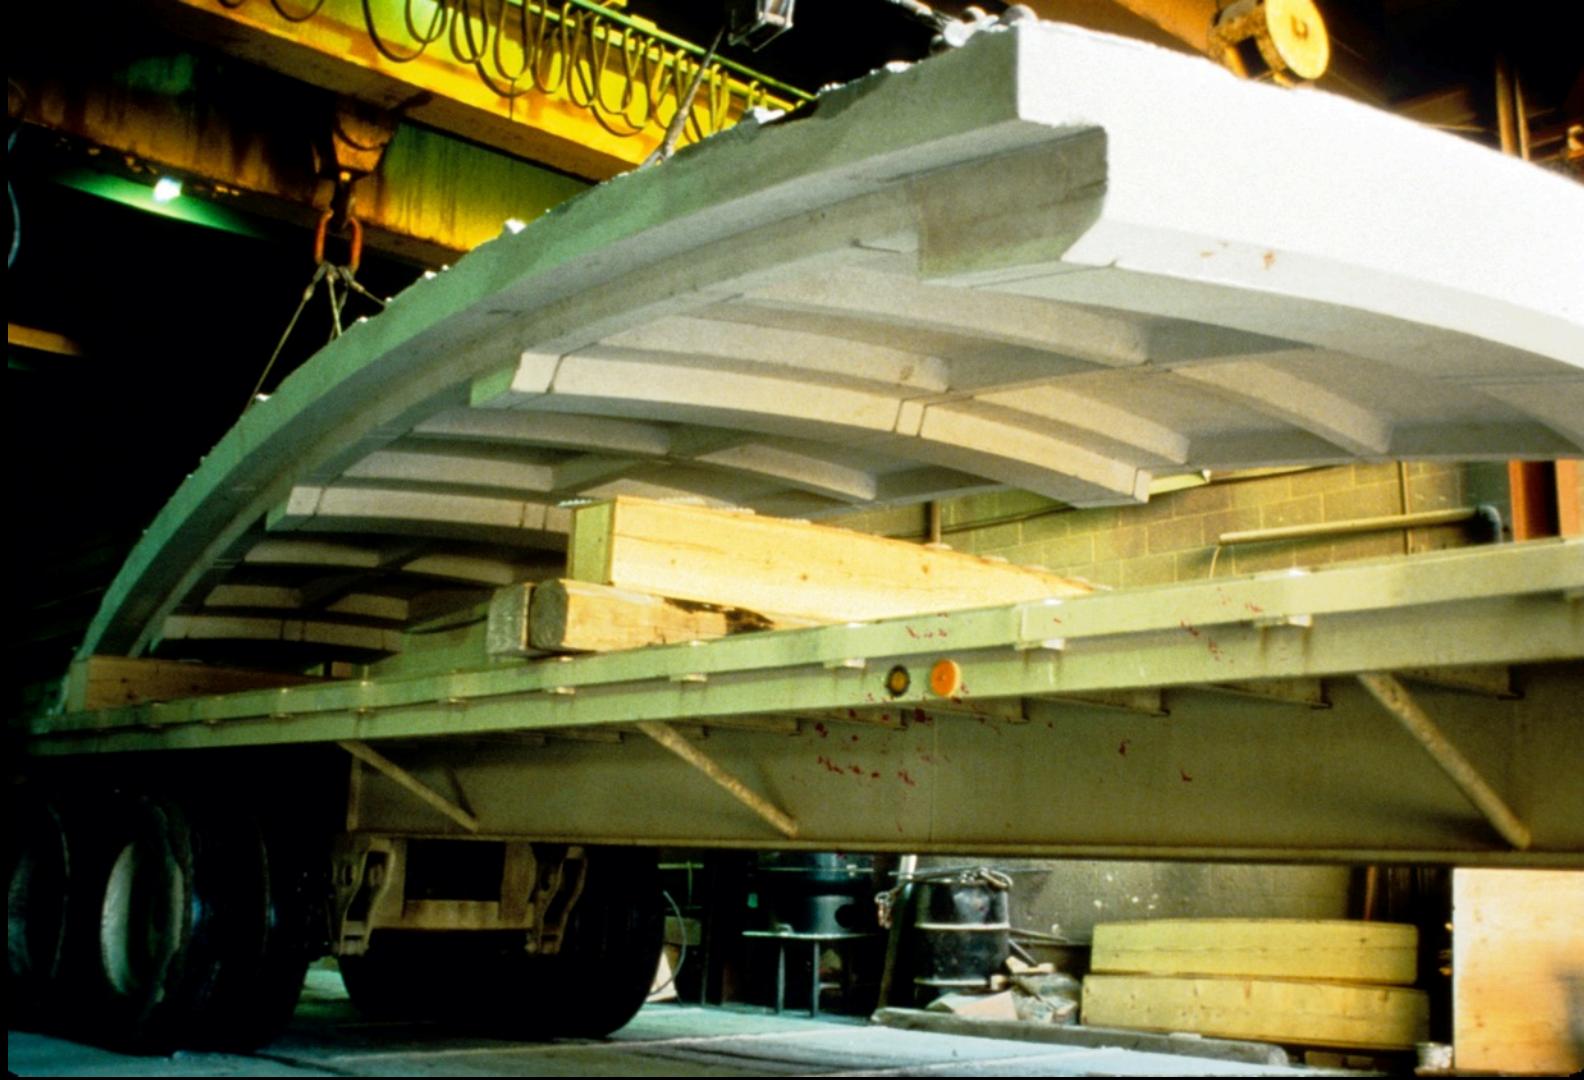

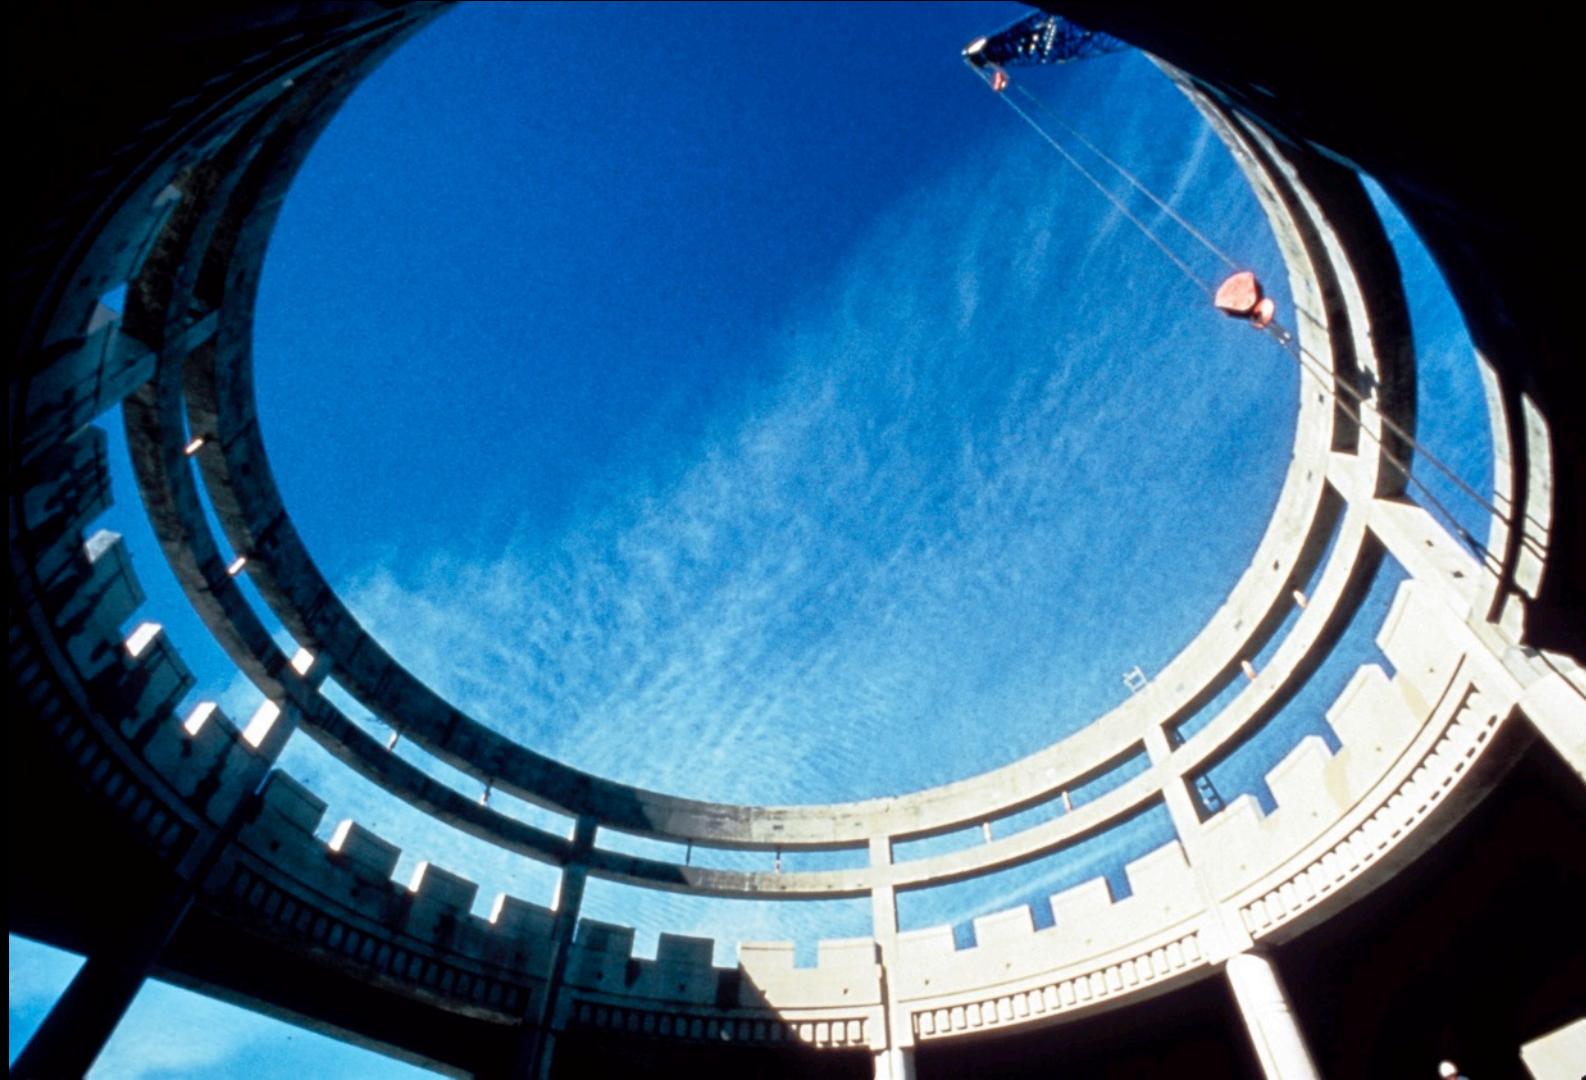

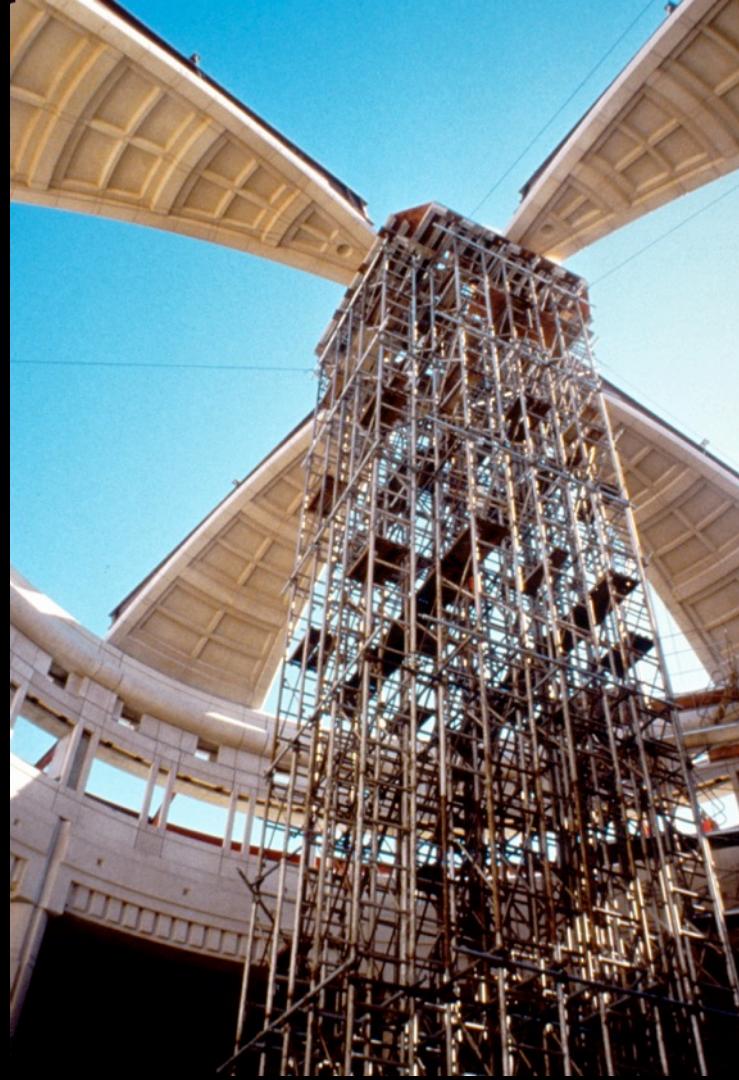

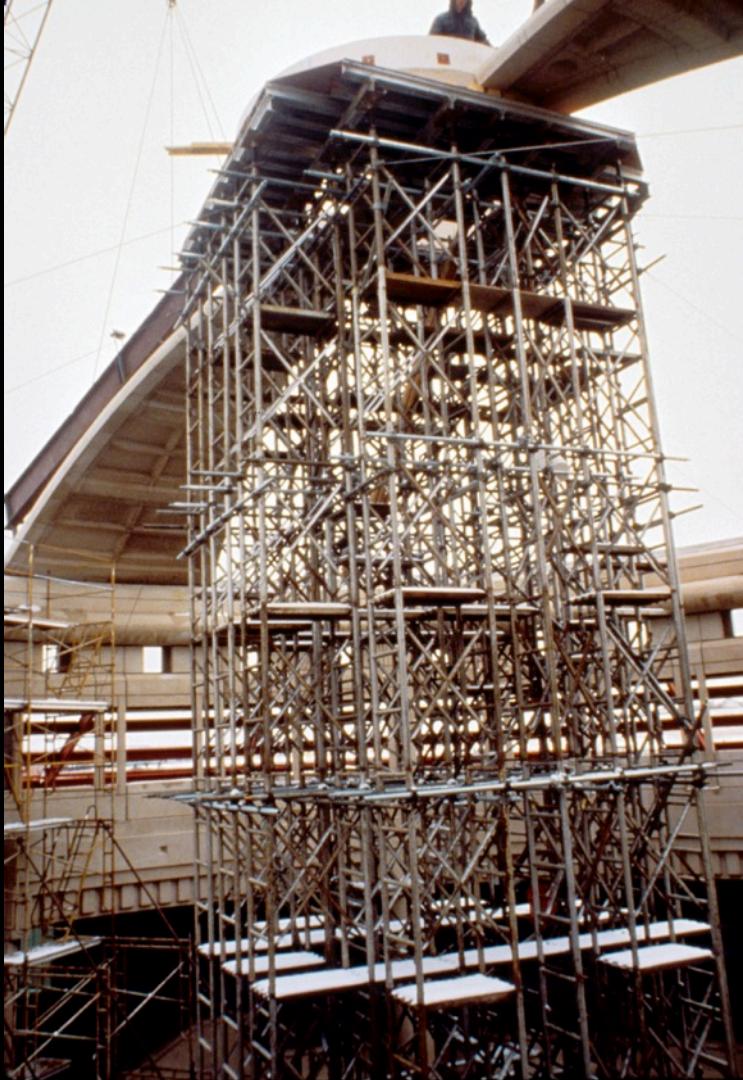

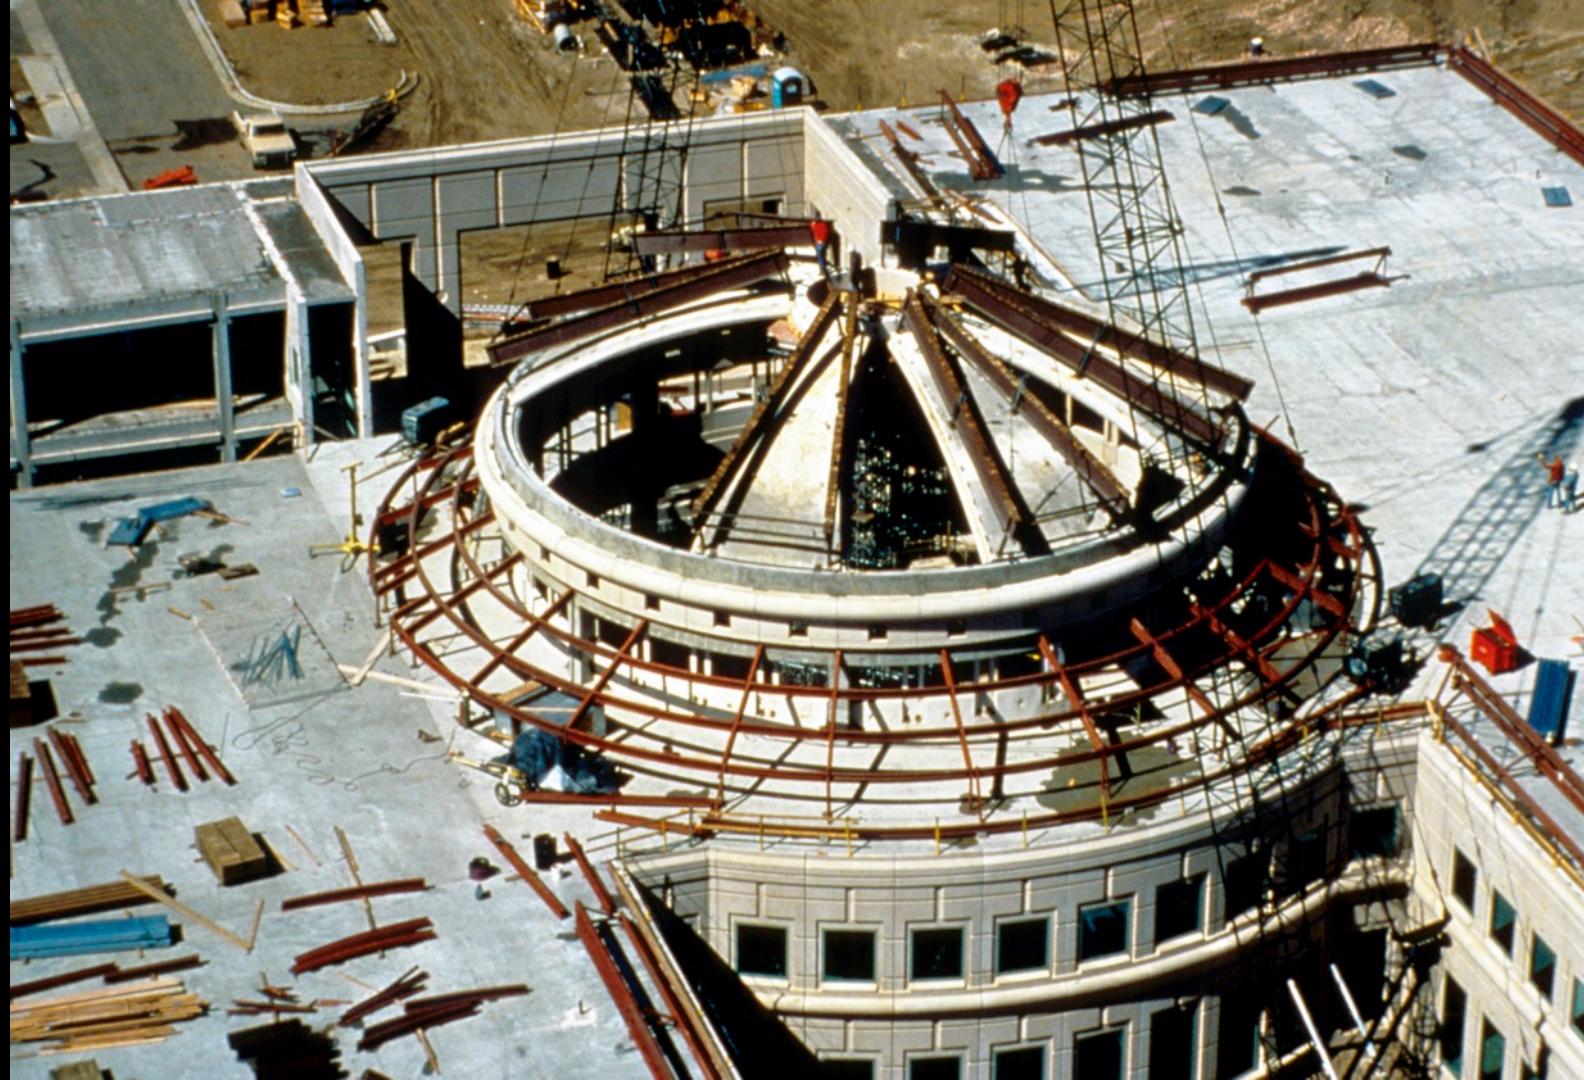

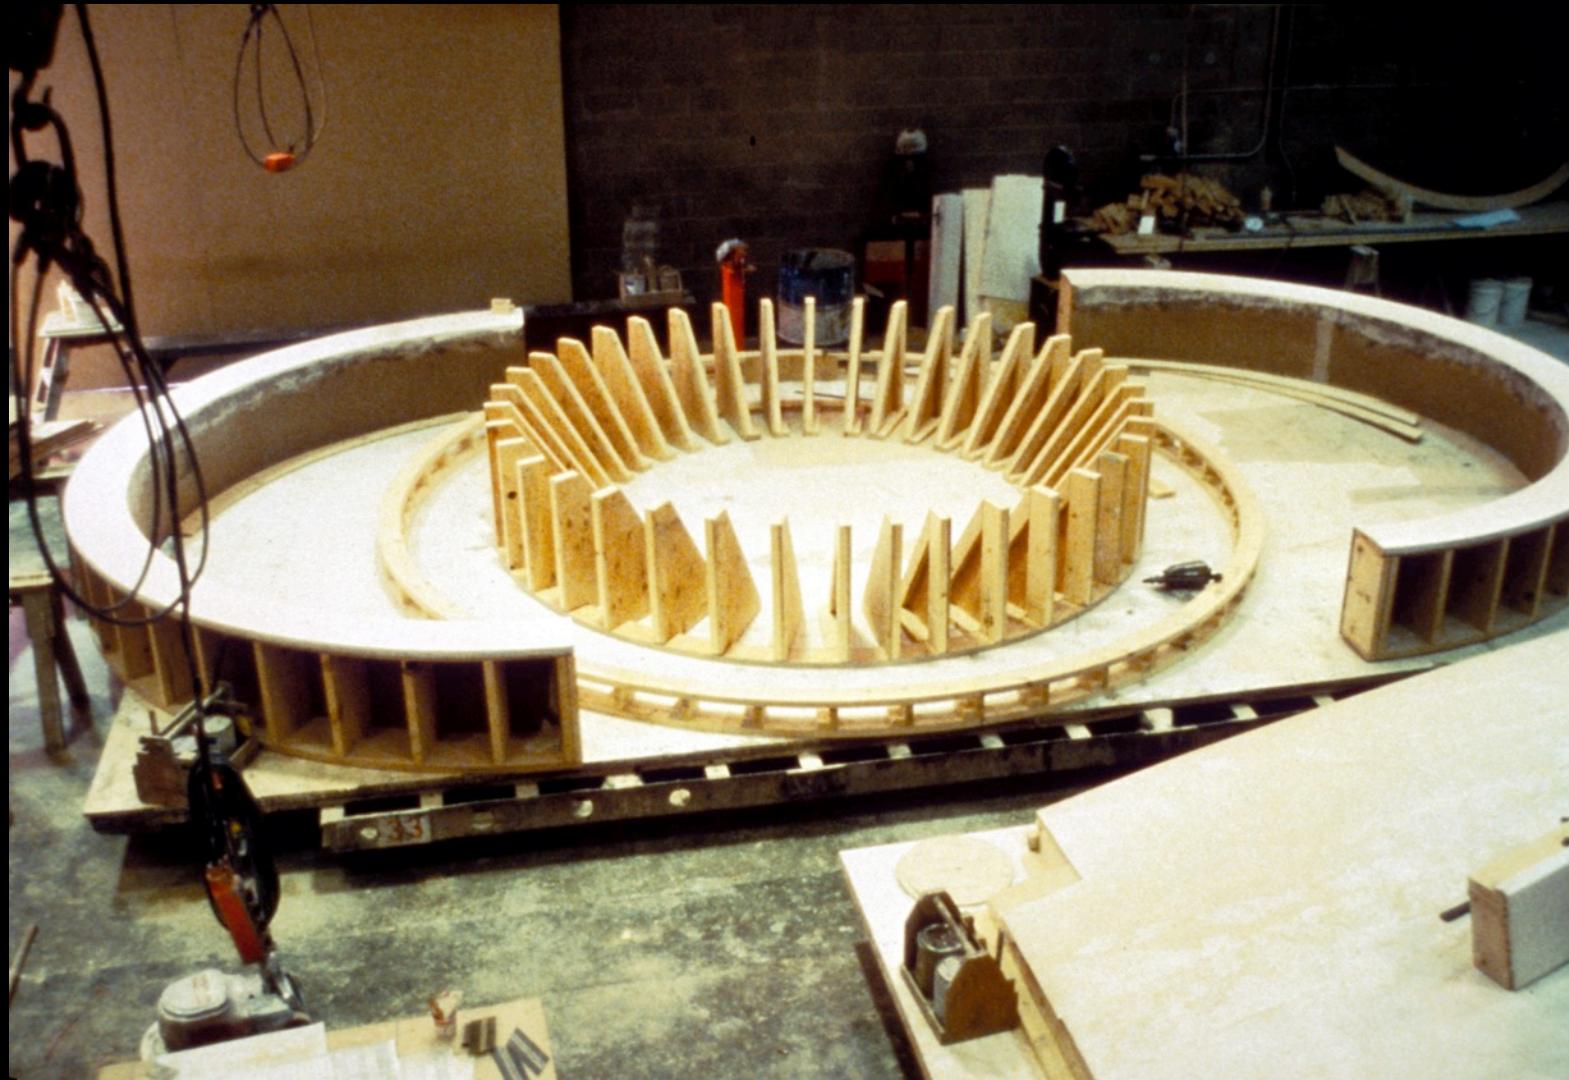

Prestressed Concrete:

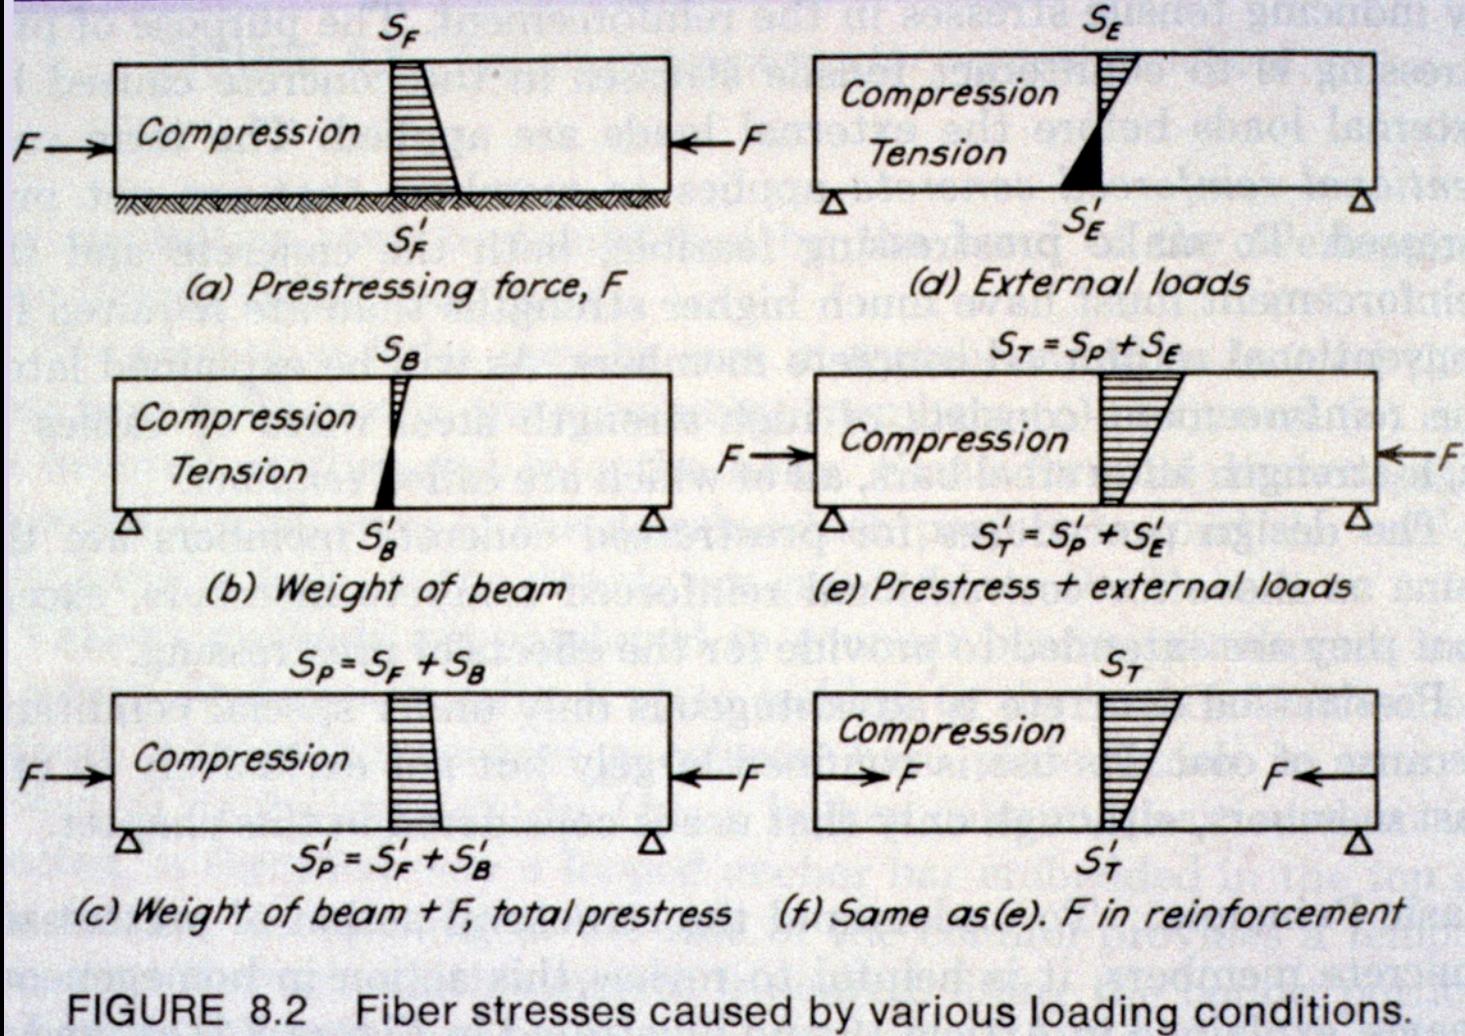

Prestressed is the general term referring to BOTH pre-tensioned and post-tensioned forms

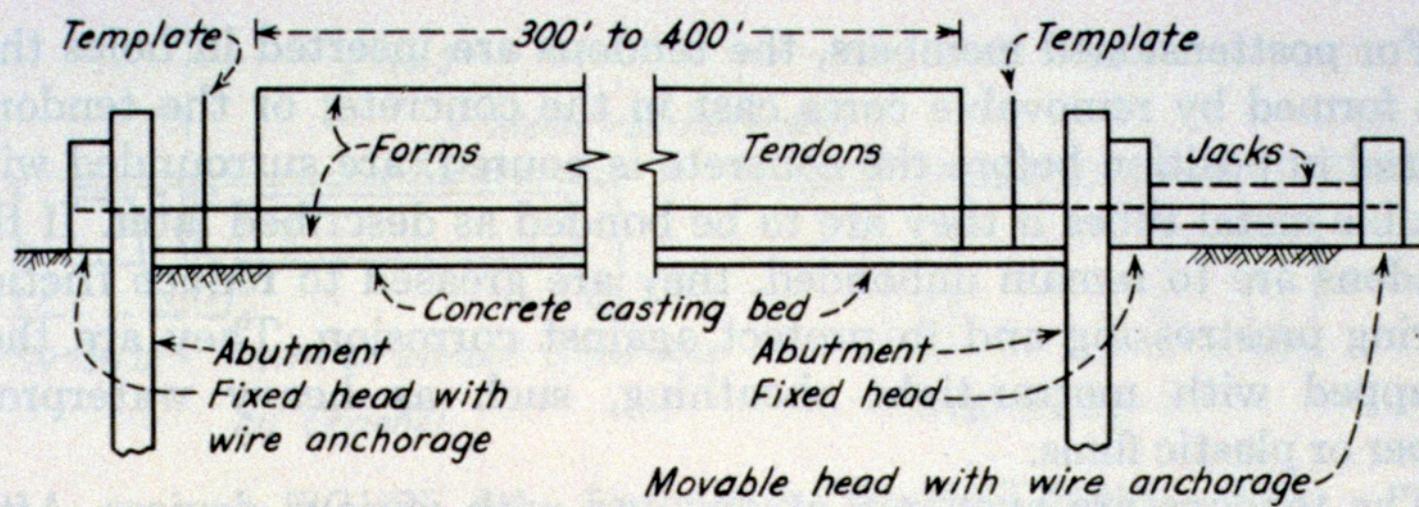

Pre-tensioned concrete:

Where the steel tendons are inserted and stretched BEFORE the concrete is placed and has set

Post-tensioned Concrete:

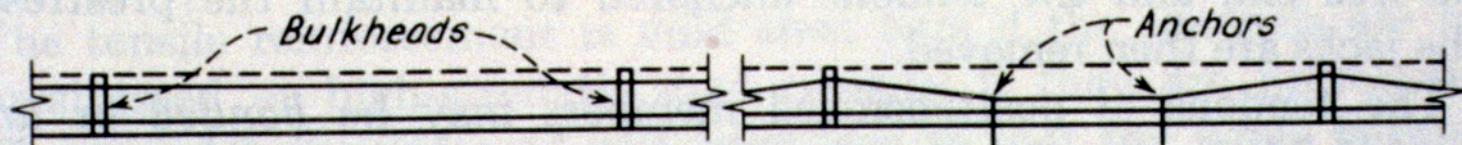

Normally where conduits are positioned in the concrete forms, concrete is placed around and cured, THEN the steel tendons are inserted and stretched.

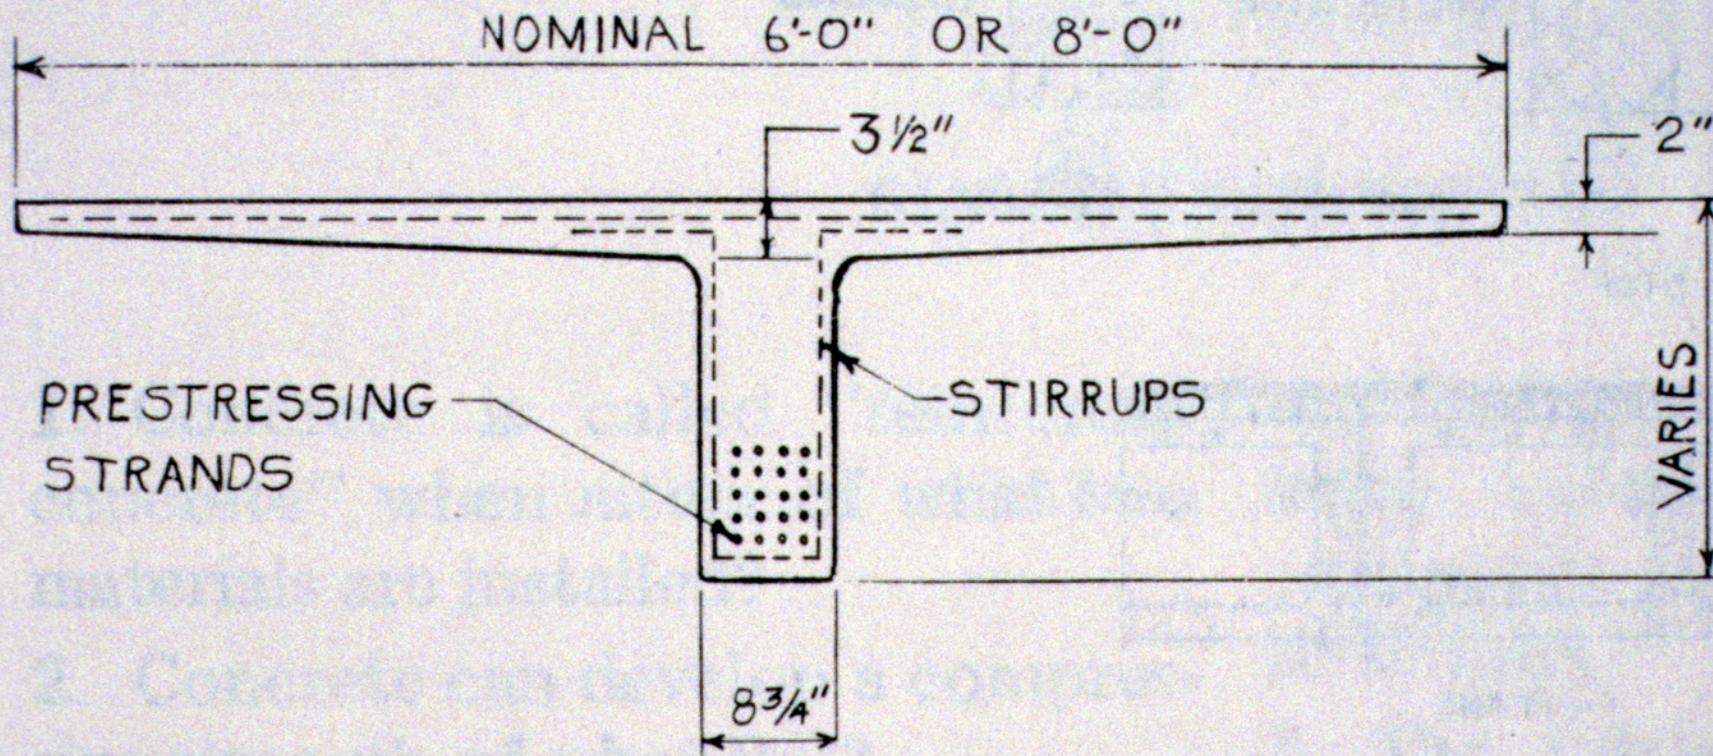

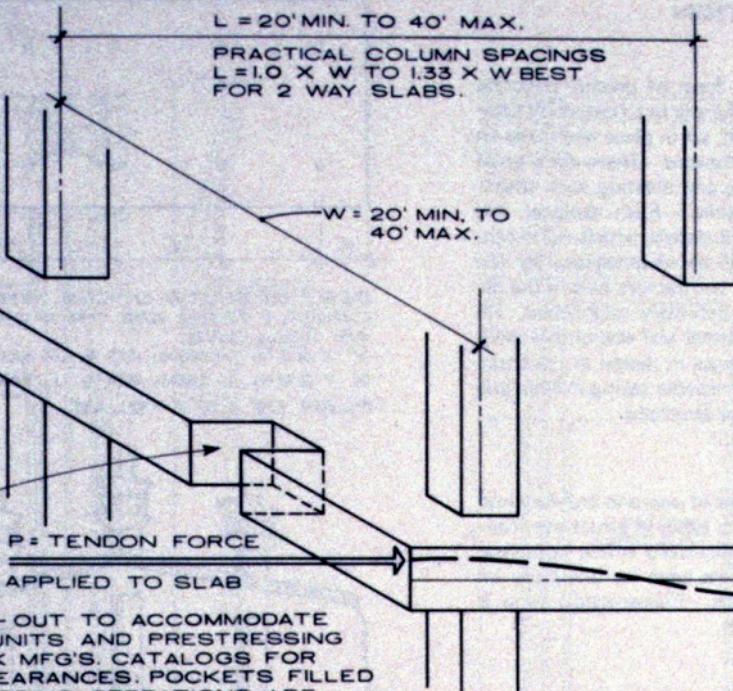

Figure 11-10. Typical Prestressed Tee Section

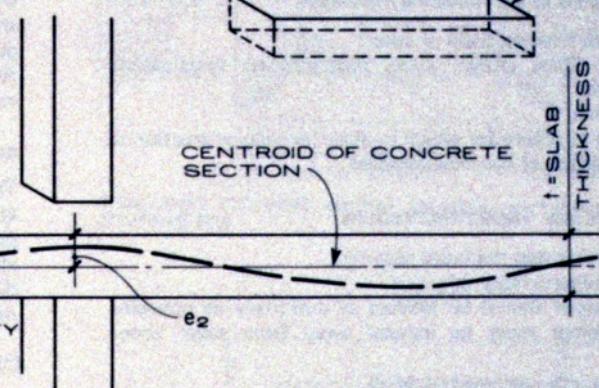

L = 20' MIN. TO 40' MAX.

PRACTICAL COLUMN SPACINGS
L = 1.0 X W TO 1.33 X W BEST
FOR 2 WAY SLABS.

W = 20' MIN. TO
40' MAX.

INTERIOR SLAB BLOCK - OUT
WITH CENTRAL STRESSING
SYSTEM. TWO TENDONS STRESSED
SIMULTANEOUSLY WITH SPECIAL
JACK. EXTERIOR TENDON END
ANCHORS ENCASED IN SLAB.
ELIMINATES EXTERIOR FORM BLOCK - OUTS.

RECOMMENDED SPAN/DEPTH RATIO

Draped post-tension tendons pre-compress concrete to provide resistance to tensile stresses produced by flexural bending due to dead + live loads on floor. Maximum tendon spacing should not exceed 8 times slab thickness (t).

FLOORS | 42

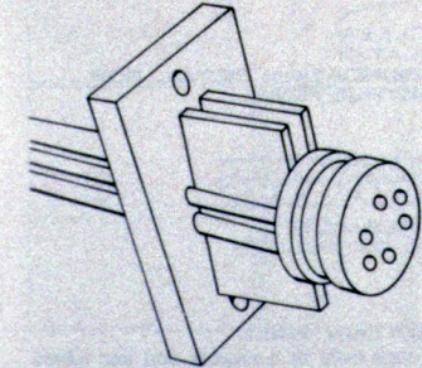

ROOF | 48

Check deflections, camber, and vibration.

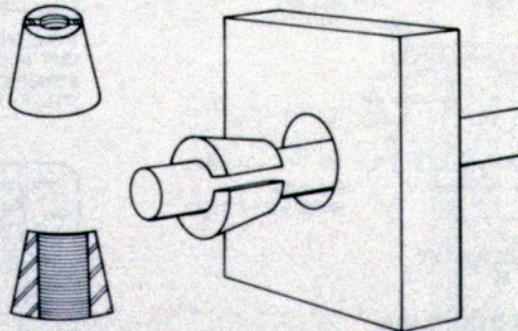

Practical solid slab thickness 6" min. to about 10" max. without drop panels. For long spans cast-in place (not lift slabs) haunched slabs or drop panels may be used. Hollow slabs or waffle slabs can also be used to reduce dead load on long spans.

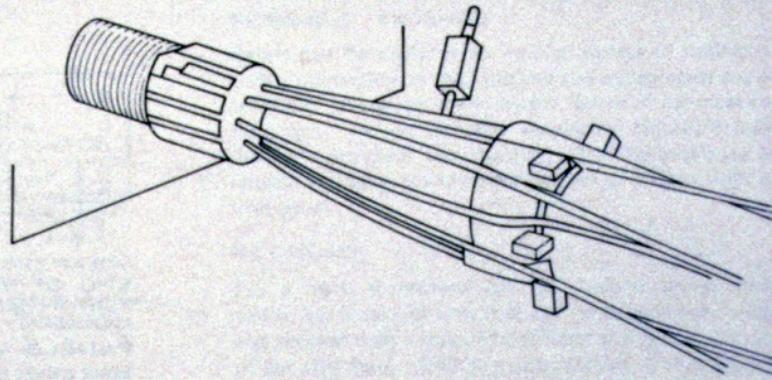

PRESCON ANCHORAGE

STRESSSTEEL BAR
ANCHORAGE

FREYSSINET WIRE ANCHOR AND JACK

NOTE:

Two-way post tensioned flat slabs average about 1 lb. of prestressing wire or strand per square foot for 24' to 28' bays. Additionally: at ordinary reinforcing steel runs about 0.5 lbs. per square foot
